COUNCIL ASSESSMENT PANEL MEETING
10 June 2020
AGENDA – 9.1

Applicant: Mark Musolino	**Landowner:** M A Musolino & R P Musolino
Agent: James Levinson – Botten Levinson	
Development Application: 13/30/473	**Originating Officer:** Melanie Scott
Application Description: Filling of land to a maximum depth of 6.2 metres (non-complying)	
Subject Land: Lot:100 Sec: P957 DP:63108 CT:5917/721; Lot:1 Sec: P957 FP:104215 CT:5141/301; Lot:101 Sec: P957 DP:63108 CT:6137/929	**General Location:** 24 & 28 & 32 Emmett Road Crafers West ***Attachment – Locality Plan***
Development Plan Consolidated : 12 April 2012 **Map** AdHi/22	**Zone/Policy Area:** Hills Face Zone
Form of Development: Non-complying	**Site Area:** 1.7 hectares
Public Notice Category: Category 3 non complying Notice published in The Advertiser on 21 April 2017 & 10 May 2019	**Representations Received:** 2 **Representations to be Heard:** 2 (previously heard 10 July 2019) Application re notified **Representations Received:** 1 **Representations to be Heard:** 0

1. EXECUTIVE SUMMARY

The purpose of this application is to enable extensions to the existing apron of fill to the north and north-west of a dwelling at 28 Emmett Road Crafers West. The works will also enable better access to the northern portion of the land for management purposes and enable the applicant to meet CFS access requirements for fire-fighting purposes. The fill also extends onto two adjoining properties at 24 and 32 Emmett Road, which are owned by others.

The application was submitted to the Council Assessment Panel (CAP) at its meeting of 10 July 2019.

At the 10 July meeting, CAP resolved to DEFER consideration of the application to allow the applicant to:

- Provide clean fill certificates or undertake soil samples, surface and ground water testing and analysis by a suitably experienced and qualified site contamination consultant to provide evidence that the fill placed on the site is not contaminated and suitable for a private open space area associated with a dwelling, and that there is no risk of pollution to surface or underground waters.

- Provide clarification of the pre 2010 land form, the existing land form with the fill in situ and the final form of the land proposed following the landscaping shown in the landscape concept plan.

The CAP report, attachments and minutes from the 10 July 2019 CAP meeting will be provided again electronically (as separate attachments indicated as “previous”) for your reference, together with this report and associated attachments.

Following the above resolution, the applicant has responded with an Environmental Soil Investigation from MUD Environmental dated 23 April 2020 and drawing **ME-296 Revision 1 figures 1, 2 & 3**. The report details seven comments regarding the suitability of the fill for residential use and a private open space area, and notes all results were below the adopted Tier 1 health based and ecological screening levels for residential land use. The report concludes that "the fill materials are not considered to present an unacceptable risk to human health or to the environment in the context of residential land use, including private open space areas." The same consultant has also clarified the actual fill levels on the site through the provision of information from the eleven (11) test pits excavated across the site. With regards to proposed landscaping the concept plan submitted with the previous CAP report has been withdrawn. There is no intent at this time to undertake "landscaping". As previously noted the fill has been in situ for some time and has revegetated naturally so weed management only is proposed at this time.

Following an assessment against the relevant Zone and Council Wide provision within the Development Plan, staff are recommending that **CONCURRENCE** from the State Commission Assessment Panel be sought to **GRANT** Development Plan Consent, subject to conditions.

2. DISCUSSION/ASSESSMENT OF THE APPLICANT'S RESPONSE

1. <u>Evidence the fill is not contaminated</u>

   The applicant's chosen path to address the CAP requests mirrors that requested in part 2 of resolution 1 of the CAP minutes, namely to undertake soil samples, surface and ground water testing and analysis by a suitably experienced and qualified site contamination consultant. MUD consultants advised the following documents were used as their guideline in undertaking the analysis:

   1. EPA '*Guidelines for the assessment and remediation of site contamination'* updated November 2019, herein referred to as the 'GAR, 2019';
   2. *National Environment Protection (Assessment of Site Contamination) Measure, 1999 as amended 2013* (ASC NEPM, 2013); and
   3. Australian Standard AS4482.1-2005 *Guide to the investigation and sampling of sites with potentially contaminated soil, Part 1: Non-volatile and semi-volatile compounds*'.

   The following table and other excerpts provides a summary of the materials encountered across the 11 test pits in the fill area and from the five (5) samples taken from natural ground level areas.

Table 7 – Materials Encountered

Layer	Description
FILL 1	SAND, silty, fine to coarse grained, gravelly, orange-brown to light brown, dry to low moisture, trace oversized (>100mm) mudstone / siltstone cobbles up to 100mm, **trace inclusions of combinations of bitumen / paving bricks / red bricks / concrete fragments / ash + cinders / ceramic tiles / black or orange plastic / PVC pipe** (possibly from adjacent building structure).
FILL 2	GRAVEL, sandy, blue-grey sub-base materials, angular gravels to 50mm, moist.
FILL 3	SAND, silty, fine to medium grained, orange, moist (sandy loam type soils).
FILL 4	CLAY, sandy, gravelly, medium plasticity, brown to dark brown, **trace oversized (>100mm) inclusions of combinations of bitumen / paving bricks / cinders / slag / red brick fragments,** moist.
FILL 5	CLAY, sandy (coarse grained), gravelly, low plasticity, light-brown to brown, **trace bitumen pieces up to 250mm, ultra-trace concrete pieces / bituminous tar, moist.**
FILL 6	CLAY, silty, low-plasticity, orange-brown to red-brown, trace calcareous gravels up to 50mm, trace whole quartz gravels to 50mm, **trace bitumen.**
FILL 7	CLAY, sandy, gravelly, low plasticity, brown, **trace oversized (>100mm) bitumen / concrete fragments, potential ACM fragments**
FILL 8	CLAY, sandy, gravelly, low plasticity, brown, **trace inclusions of combinations of bitumen / concrete / paving bricks / quartz cobble ballast up to 100mm**, moist.
FILL 9	SAND, gravelly, clayey, **trace oversized concrete / bitumen / trace steel reo**, light brown to brown, moist.
FILL 10	CLAY, silty, trace gravels, medium plasticity, red-brown, **trace oversized (>100mm) fragments of brick / pavers / concrete / bitumen.**
FILL 11	SAND, clayey, coarse grained, orange-brown, trace gravels and cobbles throughout up to 150mm.
NATURAL 1	CLAY, silty, low plasticity, trace mudstone cobbles and gravels from 10mm-300mm, orange-brown to brown, moist.
NATURAL 2	SILT, organic matter present (twigs + roots), grey to grey-brown, low moisture.
NATURAL 3	SILT, calcareous, light-brown to orange-brown, low moisture.
NATURAL 4	CLAY, silty, low-plasticity, light-brown to orange-brown, trace calcareous gravels, moist.
NATURAL 5	CLAY, silty, low plasticity, yellow-brown to white, talc-like feel, moist.

The subsurface conditions across the site were highly variable, with 11 distinct layers of fill materials and five distinct layers of natural materials observed within the test pits excavated across the site. In total, 10 out of 11 test pits contained fill materials, with only test pit TP8 containing natural materials only.

The vertical extent of fill materials encountered from the surface ranged between 0.5m depth (TP2) and 3.8m depth (TP10), with underlying natural soils confirmed at all test pit locations with the exception of test pit TP07 where fill materials existed to the maximum depth of investigation of 3.3m below ground surface.

Non-mineralogical inclusions were identified within all test pits except for TP8 (natural soils only), were present in 8 out of the 11 distinct layers of fill materials encountered, and were observed in the form of the following materials:

- Bitumen wastes ranging in size from small fragments of ~10mm up to large pieces ~400mm width (10 out of 11 test pits);
- Concrete, bricks and / or pavers (10 out of 11 test pits);
- Construction and demolition waste / building wastes including ceramic tiles / black or orange plastic / PVC pipe (5 out of 11 test pits);
- Trace ash and cinders (5 out of 11 test pits);
- Trace small fragments of slag (2 out of 11 test pits); and
- Trace remnants of partially solidified bituminous tar (1 out of 11 test pits);
- Potential asbestos containing materials (ACMs) in the form of trace grey fibre cement fragments in test pit TP07 at depths of between 1.9m-2.7m within materials designated as the 'FILL 7' layer. No other potential ACMs were encountered in any of the other test pits excavated at the site, with the 'FILL 7' layer also only observed within soils at test pit TP07.

No other observations of potential chemical impacts (i.e. odours, staining) were observed during test pitting or soil sampling activities.

PID results were recorded up to a maximum of 0.3ppm, indicating that the potential for volatile contaminants was low within the test pits excavated across the site.

1. Suitability of fill for residential and private open space uses:

a. The materials encountered in the filled area are heterogenous, with various layers of fill materials and natural soils observed within the test pits excavated across the inferred filled area at the site.
b. The depth of fill materials ranged between 0.5m and 3.8m depth below the current surface, with underlying natural soils confirmed at all test pit locations except for test pit TP07, where fill materials were present to the maximum depth of investigation of 3.3m.
c. Photoionisation detector (PID) results were recorded up to a maximum of 0.3ppm, indicating that the potential for volatile contaminants was low.
d. In addition to the soil materials, non-mineralogical inclusions were observed within most fill layers, primarily in the form of construction and demolition materials including concrete, bitumen, bricks, pavers, ceramic tiles, plastic sheeting and PVC pipe. Trace inclusions of tar, ash, cinders and slag were observed at some locations.
e. Asbestos containing materials (ACMs) were confirmed in the form of grey fibre cement fragments within test pit TP07 at depths of between 1.9m-2.7m (FILL 7 layer). No other potential ACMs were encountered in any of the other test pits excavated at the site.
f. No significant indicators of potential contamination (i.e. odours, staining) were observed during test pitting or soil sampling activities.
g. All results were below the adopted Tier 1 health based and ecological screening levels for residential land use, except for two individual benzo(a)pyrene concentrations in near surface soils (0.1-0.2m) at locations TP3 and TP6. A Tier 2 risk assessment comprising statistical assessment and review of toxicological data for benzo(a)pyrene was undertaken, which confirmed that these concentrations do not present a risk to human health or ecological risk in the context of residential use. On this basis, the fill materials are not considered to present an unacceptable risk to human health or the environment in the context of residential land use, including private open space areas.

2. Risk to surface or underground waters from the fill:

a. No significant soil concentrations were identified in soils at the site that are considered to threaten surface or groundwater. As stated in the ASC NEPM, '*Groundwater protection may be a particular concern where contamination occurs in sandy soils containing naturally low levels of organic matter, clay and trace elements. In most situations, soil contaminants at levels below appropriate EILs or HILs do not pose a threat to local groundwater sources.*' On this basis, no risk to surface or underground waters has been identified.

In a very brief summary of the report excerpts provided here, the fill is suitable for residential use and is not contaminating ground water. The report recommendations detailed below are proposed as notes should Development Plan Consent be granted.

2. <u>Pre 2010 Land Form and Final Land Form</u>

With regard to the second request from the CAP, drawings have been provided to demonstrate the level of fill. But it should be noted each of the test pits were dug until natural ground was reached and the fill level across the site ranges from nothing (natural ground level) up to a maximum of 5 metres (the maximum depth able to be excavated). All but one test pit was dug to natural ground level (the exception being test pit 7). Of further note, non-mineralogical inclusions were identified in all test pits except test pit 8 where natural soils only were found.

Four recommendations were made by the site contamination consultant:

1. Any soil imported to the site should be sourced from a commercial supplier where possible. Should waste soils be generated from another site to be imported to this site, the soils should be classified and imported in accordance with EPA requirements.
2. All surplus soils to be removed from the site must be managed in accordance with relevant EPA guidelines and/or requirements of waste or recycling depots authorised by the EPA.
3. Construction and demolition waste materials should be disposed off-site in accordance with the requirements of waste or recycling depots authorised by the EPA.
4. Should any unforeseen materials (including asbestos containing materials) be identified during any excavation works and/or soil handling and management activities, it is recommended that these soils are quarantined, and further advice is sought from an appropriately qualified environmental consultant.

It is suggested these recommendations be added as notes to any approval for the development (refer notes 5 - 8 of report recommendation).

No landscaping is now included in the proposal. The landscaping previously proposed was aesthetic and included small rock retaining less than a metre in height and which in my opinion made no contribution to stabilising the fill. Zone PDC 4 requires development not to occur on land where the slope poses an unacceptable risk of soil movement, land slip or erosion. There has been no reported soil movement occurrences in the six years or more that the fill has been on site, including the above average rainfall year of 2013. The removal of the proposed landscaping has not altered staff's assessment of the proposal being in accordance with PDC 4.

Further, staff have referred to the document provided by the applicant in the original CAP attachments from Ecological Associates Pty Ltd dated 23 November 2017 which details the level area of fill as 750m^2 and the battered slopes as being some 650m^2. Noting the fill has been in place for at least six years without movement and, the aforementioned report identifies the battered slope has naturally revegetated with exotic shrubs, grasses and herbs (page 112 of previous CAP attachments) there is no intention to undertake any formal landscaping of the area. Maintenance in the form of weed management will be undertaken in accordance with the recommendations of the aforementioned report. An advisory note is included in the recommendation reminding the applicant further earthworks greater than 9 cubic metres on the subject land require separate development approval.

3. SUMMARY & CONCLUSION

This application was presented to CAP in July 2019 and deferred pending the provision of further information. That information was provided in April and May 2020 and details that the fill is suitable for residential use and is not impacting on groundwater quality.

The application is retrospective for extensive filling of land in the Hills Face Zone. Because of the age of the existing dwelling there are poor records surrounding the associated access and earthworks arrangements and, with the time elapsed since the fill was undertaken, there is speculation regarding the form of the land prior to the works. The extent of the works has now been verified through bore logs. There is no doubt when the work was first undertaken it was a very visible scar on local visual amenity. The fill extends onto two neighbouring properties which are now included as part of the subject land. The MUD report reveals the extent of fill on 32 Emmett Road is minimal as evidenced on site survey drawings on pages 68, 69 & 70 of the MUD Report. Furthermore the findings for test location pit 5, shown on page 27 of the MUD Report, demonstrated 0.7m of fill only and supporting the applicants assertion and the plans provided that there is little to no fill in the vicinity of the boundary with 32 Emmett Road. Page 82 of the report records the bore log findings for test location pit 5.

In considering the merits of the proposal, Council staff have noted that there are many properties in the locality with extensive land modification to accommodate recreational uses. The surface area of the fill is 1,400m^2 or approximately 12% of the 176,000m^2 site area. Thus in the context of the locality this proposal is considered modest. The proposal retains much of the land in its natural character, particularly on the steeper parts of the land. Whilst the proposal does not return the land to its natural form, it does seek to minimise the visual impact through managing the weeds and revegetation on the banks of the fill and creates opportunities for improved vegetation and fire management for the balance of the subject land. The CFS has confirmed there is no increased fire risk as a result of this proposal and that the proposal assists in emergency vehicle access to the dwelling on the site.

It is considered that the proposal is sufficiently consistent with the relevant provisions of the Development Plan, despite its non-complying nature, and variance with some provisions. These variances are not viewed to be significant and it is considered the proposal is not seriously at variance with the Development Plan. In the view of staff, the proposal has sufficient merit to warrant consent. Staff therefore recommend that **CONCURRENCE** from the State Commission Assessment Panel be sought to **GRANT** Development Plan Consent**,** subject to conditions.

4. RECOMMENDATION

A. That the Council Assessment Panel considers that the proposal is not seriously at variance with the relevant provisions of the Adelaide Hills Council Development Plan, and seeks the CONCURRENCE of the State Commission Assessment Panel to GRANT Development Plan Consent to Development Application 13/30/473 by Mark Musolino for Filling of land to a maximum depth of 6.2 metres (non-complying) at 24, 28 & 32 Emmett Road Crafers West subject to the following conditions:

(1) <u>Development In Accordance With The Plans</u>
The development herein approved shall be undertaken in accordance with the following plans, details and written submissions accompanying the application, unless varied by a separate condition:

- **Statement of support prepared by Mark Musolino dated 17 January 2013**
- **Statement of effect prepared by Botten Levinson dated March 2017**
- **Vegetation Restoration Report prepared by Ecological Associates Pty Ltd dated 23 November 2017**

- **Survey plans (sheets 1, 2 and 3 of 3 reference 3856 plan 3856XI) titled site levels & contour plan and enlargements prepared by Olden and Van Senden Pty Ltd dated 4 October 2012 and 1 August 2014**
- **Tree Management Plan prepared by Gordon Sykes dated 23 July 2014 and received by Council 25 February 2016**
- **Site Location and Layout Plan, Site Elevation & Topographic Contours plan and Inferred Extent of Imported Fill Materials & Test Pit Locations (October 2019) prepared by MUD Environmental reference ME-296 Revision 1 figures 1, 2 & 3 received by Council.**

REASON: To ensure the proposed development is undertaken in accordance with the approved plans.

NOTES

(1) Development Approval Expiry

This development approval is valid for a period of twelve months commencing from the date of the decision notification. However if the development hereby approved is substantially commenced within the twelve (12) month period then it shall be completed within three (3) years of the date of such notification. This time period may be further extended beyond the 3 year period by written request to and approval, by Council prior to the approval lapsing. Application for an extension is subject to payment of the relevant fee. Please note that in all circumstances a fresh development application will be required if the above conditions cannot be met within the respective time frames.

(2) Requirement For Further Applications

The applicant is reminded any fencing and earthworks greater than 9 cubic metres requires development approval and will be the subject of separate application.

(3) Existing Encroachment Identified

The fill which encroaches over the side boundary into 24 Emmett Road remains unresolved. This development authorisation in no way implies approval from Council for this encroachment. The applicant is encouraged to continue negotiations with 24 Emmett Road to resolve this new and historical encroachment which will likely require a further application to Council to rectify this situation.

(4) Works On Boundary

The development herein approved involves work within close proximity to the boundary. The onus of ensuring development is in the approved position on the correct allotment is the responsibility of the land owner/applicant. This may necessitate a survey being carried out by a licensed land surveyor prior to the work commencing.

(5) Any soil imported to the site should be sources from a commercial supplier where possible. Should waste soils be generated from another site to be imported to this site, the soils should be classified and imported in accordance with EPA requirements.

(6) All surplus soils to be removed from the site must be managed in accordance with relevant EPA guidelines and/or requirements of waste or recycling depots authorised by the EPA.

(7) Construction and demolition waste materials should be disposed off-site in accordance with the requirements of waste or recycling depots authorised by the EPA.

(8) Should any unforeseen materials (including asbestos containing materials) be identified during any excavation works and/or soil handling and management activities, it is recommended that these soils are quarantined, and further advice is sought from an appropriately qualified environmental consultant.

(9) Erosion Control During Construction
Management of the property during construction shall be undertaken in such a manner as to prevent denudation, erosion or pollution of the environment.

(10) EPA Environmental Duty
The applicant is reminded of his/her general environmental duty, as required by Section 25 of the Environment Protection Act *1993*, to take all reasonable and practical measures to ensure that the activities on the whole site, including during construction, do not pollute the environment in a way which causes, or may cause, environmental harm.

(11) Department of Environment, Water & Natural Resources (DEWNR) – Native Vegetation Council Note
The applicant is advised that any proposal to clear, remove limbs or trim native vegetation on the land, unless the proposed clearance is subject to an exemption under the Regulations of the Native Vegetation Act 1991, requires the approval of the Native Vegetation Council. The clearance of native vegetation includes the flooding of land, or any other act or activity that causes the killing or destruction of native vegetation, the severing of branches or any other substantial damage to native vegetation. For further information visit:
www.environment.sa.gov.au/Conservation/Native_Vegetation/Managing_native_vegetation

Any queries regarding the clearance of native vegetation should be directed to the Native Vegetation Council Secretariat on 8303 9777. This must be sought prior to Full Development Approval being granted by Council.

B. Should Development Plan Consent be granted to this application, staff recommend the CAP provide delegation to the Assessment Manager to resolve any further application to vary the proposal.

January 17, 2013

Adelaide Hills Council
28 Onkaparinga Valley Road
WOODSIDE SA 5244

Subject: Letter of support for Development application.

I would like to indicate my view on the purpose of the proposed development at LOT: 100 SEC: P957 DP: 63108 CT : 5917/721 known as 28 Emmett Road CRAFERS WEST.

The development will incorporate general landfill to areas near the existing dwelling. Clean landfill will cover existing blackberry bushes to create a safe decent to the rear of the dwelling and access for a fire truck. A large rainwater tank and swimming pool is planned for future development that will provide a water reserve in the event of a fire. The proposed development is aligned with the needs of the residents and of our community and we expect a positive impact on the following;

- ✓ A clearer and cleaner zone around the existing dwelling to minimise fire danger to the dwelling and its surrounding neighbours.
- ✓ A larger area for the accommodation of fire trucks in the event of a bush fire.
- ✓ The abolishing of noxious bushes (blackberry) that threatened the safety of young children.
- ✓ Maintaining hills face appeal and further enhancing the habitat with the vegetation of native grasses from the area.

Please accept this letter as formal recognition of the value of this proposal in helping maintain and develop the role of fire safety in the community. In 2004 the Mt Osmond bush fire had threatened the lives of the inhabitants and their property. The fire had crossed the freeway and was heading up the hill towards Crafers West. The residents activated the copper sprinkler system then chose to leave. Thankfully the fire was extinguished before it reached Crafers West.

At that time the ability for fire trucks to enter the property and gain strategic positioning above the hill would have been near impossible. With this proposed development the option is now available and I welcome the fire department to visit the property to confirm and record such for their consideration. Over the years horrendous tragedies have occurred due to bushfires and continue to happen as a result of many factors. This development will minimise the danger to the property and its surroundings without much negative impact to the hills face. In the development the proposal to vegetate exposed soil as a result of covering the blackberry bushes will improve the natural landscape and the green character of the Adelaide Hills.

Sincerely,

Mark Musolino

Owner

Lawyers

Statement of Effect

DA 2013/30/473

Mark Musolino

MARCH 2017

Statement of Effect pursuant to section 39(2)(d) of the *Development Act 1993* and Regulation 17(4) of the *Development Regulations 2008*

Development application numbered 2013/30/473 seeking development approval for a development described by the Council as '*Filling of land to a maximum depth of 4 metres (non-complying)*' for Mr Mark Musolino at Crafers West.

1. BACKGROUND

Mr Musolino has owned the land at 28 Emmett Road, Crafers West, which land is comprised in Certificate of Title Volume 5917 Folio 721 (**the land**), with his wife Mrs Rosine Musolino, since 2004.

In August 2012, Mrs and Mrs Musolino were served with an enforcement notice by the Council under section 84(2) of the *Development Act 1993* (**the Act**) relating to the alleged unlawful deposit of fill on the land in the vicinity of the existing dwelling. The enforcement notice, amongst other things, required the installation of hay bales along the entire length of the base of the fill. This was actioned immediately by my client and inspected by the Council.

On 17 January 2013, the Council received a development application from Mr Musolino to formalise the situation on the land relating to the abovementioned fill. This application was designated as DA 2013/30/473 by the Council (**the application**).

This Statement of Effect for the application is prepared pursuant to section 39(2)(d) of the *Development Act 1993* and Regulation 17(4) of the *Development Regulations 2008* (**the Regulations**).

In preparing this Statement of Effect, the proposal has been reviewed with respect to the relevant provisions of the Adelaide Hills Council Development Plan, consolidated 12 April 2012 (**the Development Plan**). This was the relevant consolidation of the Council's Development Plan at the time the application was lodged.

The land is located within the Hills Face Zone of the Development Plan. Within the Residential Zone the list of non-complying development includes "*Filling where the height of filling of land exceeds 1.0 metre above natural ground level except for underground homes, underground tanks and cellars*".

In preparing this Statement of Effect, regard has also been had to the following plans and documents, which have been submitted to the Council:

Plans and details:

(a) Tree Management Plan prepared by Gordon Sykes dated 23 July 2014 (**the arborist report**); and

(b) Survey plan prepared by Olden & van Senden Pty Ltd and dated 4 October 2012 (**the survey**).

I also note the Council's letter dated 1 August 2016, which advised that the Council had resolved to proceed with an assessment of the application and invited the production of his Statement of Effect, and invited Mr Musolino to amend the application plans to include a fire access track previously discussed.

Accordingly, Mr Musolino approached Olden and van Senden Surveyors to prepare a supplementary plan,[1] indicating further cutting and filling required for a fire access track. The plan is **enclosed** with this Statement of Effect.

2. DESCRIPTION AND NATURE OF PROPOSED DEVELOPMENT

In or around late 2011, clean soil was brought to the land and spread to the north and western sides of the existing dwelling on the land (**the filling site**) to create a more level area around the existing dwelling (**the development**).

The Council has described the proposed development as being for "*Filling of land to a maximum depth of 4 metres (non-complying)*".

The extent of the filling is depicted by the survey which reflects the post-fill levels of the land

3. SUBJECT LAND AND LOCALITY

The land (depicted in blue on figure 1 below) comprises a single, elongated allotment with an area of approximately 13,300 square metres. At its southern boundary it has frontage to Emmett Road of approximately 19 metres.

Figure 1 *- satellite photograph of the land (Property Location Browser)*

[1] "Track Design Option 1", OLVS Surveys (Ref 3856) dated 1 February 2017.

The land naturally slopes downward from south to north (refer figure 2 below), with the existing dwelling situated on the higher section of the land. The gradient of the land increased significantly to the rear of the existing dwelling.

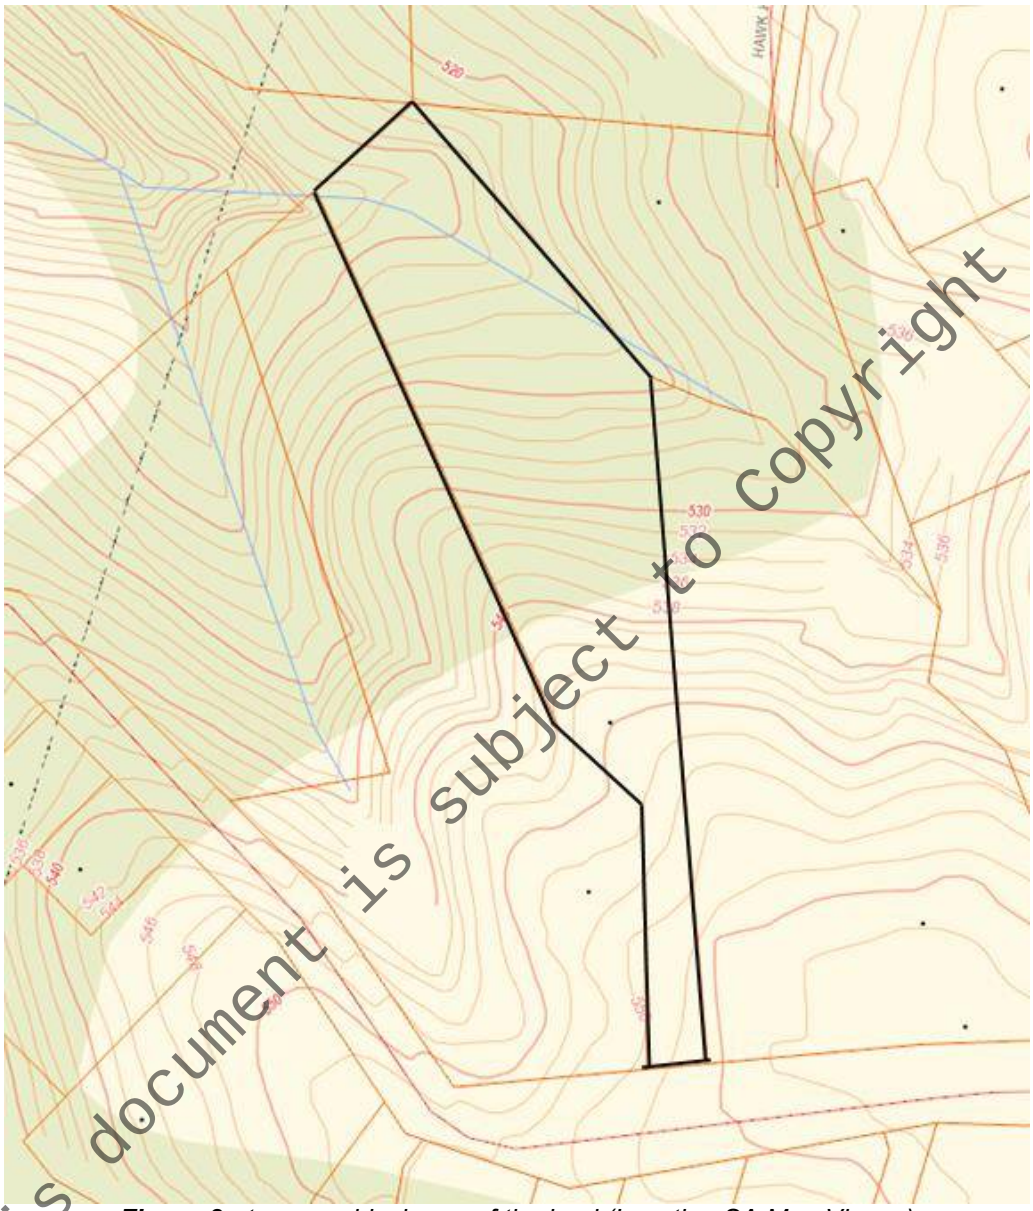

Figure 2 *- topographical map of the land (Location SA Map Viewer)*

One "SA Blue Gum" (*Eucalyptus leucoxylon*) which, by virtue of its size, is classified as a "significant tree" for the purpose of the Act and Regulations is located on the land to the west of the existing dwelling, proximate to the filling site.

Two further SA Blue Gums are located proximate to the filling site, to the north of the existing dwelling. Neither of these two trees is classified as "regulated" or "significant" for the purposes of the Act or Regulations.

Prior to the development being undertaken, I am instructed that the filling site was vegetated intensively with blackberry bushes.

The land is bounded to the east and west by other large residential allotments. Further east and to the north, between the land and the South Eastern Freeway, are smaller residential allotments. The Brooks Gully reserve is located to the northwest of the land.

4. DEVELOPMENT PLAN

As mentioned above, the land is located within the Hills Face Zone of the Development Plan (**the Zone**). The land is also located within a High Bushfire Risk area pursuant to *Figure AdHi(BPA)/1* of the Development Plan.

5. DEVELOPMENT PLAN ASSESSMENT

The provisions of the development plan relevant to an assessment of the application, are listed in Appendix 1, and can be broken down into the broad categories of:

(a) amenity;

(b) access and safety;

(c) natural vegetation and significant trees; and

(d) appropriateness of filling in the Zone.

The application is assessed against these provisions as follows:

5.1 Amenity

The filling site is not in an area that is extensively visible from any public road or neighbouring allotment.[2]

Due to its location in an area which is not prominent, the development has a minimal visual effect of natural features scenically attractive areas[3] and the amenity of the locality is not impaired by the appearance of the filling.[4]

If anything, the development has increased the amenity of the immediate locality by replacing the area of noxious blackberry bushes with a cleaner, more visually appealing area.

The proposed development therefore meets the relevant Development Plan provisions regarding amenity.

5.2 Access and safety

The development has created a flatter area around the existing dwelling on the land. This area created a larger, clearer space around the existing dwelling, and safer vehicular descent towards the rear of the site, which now has the ability to accommodate fire trucks in the event of

[2] Council Wide PDC 230.
[3] Council Wide PDC 201.
[4] Council Wide Objective 87.

bushfire. This access has the potential to benefit both residents of the land and neighbours in the event of bushfire.

Bushfires have historically occurred in the locality and the development will allow fire trucks to utilising the high portion of the subject land as a strategic fire fighting position should the need arise.

As such the development ensures a high level of safety[5] and provides safe and easy access for emergency vehicles to conduct fire fighting operations.[6] The development ensures that emergency vehicles are not faced with rugged terrain upon accessing the land.[7] The development has resulted in residential development which minimises the potential for personal and property damage resulting from bush fire.[8]

The proposed development therefore meets the relevant Development Plan provisions regarding access and safety.

5.3 Natural vegetation and significant trees

The significant tree and other native trees have been unaffected by the protective measures recommended by the arborist report and subsequently implemented by my client. Also, as set out above, the filling, with clean soil, has replaced an area of noxious blackberry bushes with an area that will facilitate the growth of native grasses.

As such, there have been minimal adverse affects to significant trees[9] and natural vegetation has been preserved (with the reestablishment of further natural vegetation facilitated).[10] The arborist report sets out that, in light of the recommended protective measures being implemented, that the aesthetic appearance, health and integrity of the significant tree, including its root system, will not be adversely affected.[11]

The proposed development therefore meets the relevant Development Plan provisions regarding natural vegetation and significant trees.

5.4 Appropriateness of filling in the Zone

It is accepted that the Zone envisages that filling be kept to a minimum[12] and the Council Wide provisions seek that filling be limited to a height no greater than 1.5 metres.[13]

However, given that the filling in question:

(a) does not pollute groundwater;

[5] Council Wide Objective 11.
[6] Council Wide PDCs 49, 80 and 306.
[7] Council Wide PDC 300.
[8] Council Wide PDC 82 and Objective 107.
[9] Council Wide PDC 337.
[10] Council Wide PDC 202.
[11] Council Wide PSC 339.
[12] Zone PDC 2.
[13] Council Wide PDC 7.

(b) does not adversely effect significant trees or other natural vegetation;

(c) provides for the reestablishment of native grasses;

(d) is protected against erosion; and

(e) impacts positively upon the amenity of the locality;[14]

combined with the access and safety benefits mentioned above, it is submitted that, in all the circumstances, it is appropriate in the Zone.

6. ASSESSMENT OF EXPECTED SOCIAL, ECONOMIC & ENVIRONMENTAL EFFECTS

It is to be noted that, unlike many non-complying development applications, the application is for a relatively low key form of development. As such, there are limited social, economic and environmental impacts that stem from it. I will, however, set out these limited impacts below.

6.1 Social

The increase to the amenity of the filling site combined with the increase to the safety of the local community from bushfires that results from the development highlights its positive social impacts. No negative social impacts have arisen as a result of the development.

6.2 Economic

There are no negative economic impacts associated with the development. The increased level of protection to the locality from bush fires can be seen as a positive economic impact.

6.3 Environmental

The development involved the removal of an area of noxious blackberry bushes and its replacement with an area facilitative of native grass regrowth. A significant tree and other natural vegetation have been protected and retained. In these regards, the development has displayed a positive impact on the environment. No negative environmental impacts have arisen as a result of the proposed development.

7. CONCLUSION

The designation of a kind of development as non-complying affects the procedures governing the processing of an application, but is not determinative of whether Development Plan consent should be granted or refused.[15] There is no presumption against the granting of consent to an application simply because it is “non-complying”.

[14] Zone PDC 3.
[15] *Klein Research Institute v District Council of Mount Barker* [2000] SASC 377.

The proposal has been assessed against the relevant provisions of the Development Plan. Amongst other things, it is noted that the filling:

- is not in a location that is visually prominent and, in any event, positively contributes to the amenity of the immediate locality;
- does not adversely impact significant trees or other natural vegetation and provides for the reestablishment of native grasses; and
- allows for greater security from the risk of bushfire for the residents of the land and for their neighbours.

The proposal is therefore considered to be worthy of development approval.

Dated 30 March 2017

Yours faithfully

James Levinson

Appendix 1 - relevant Development Plan provisions

Council Wide PDC 7:

The excavation and/or filling of land should:

(a) be kept to a minimum and be limited to no greater than 1.5 metres to preserve the natural form of the land and the native vegetation;

(b) only be undertaken to reduce the visual impact of buildings, including structures, or to construct water storage facilities for use on the allotment;

(c) only be undertaken if the resultant slope can be stabilised to prevent erosion; and

(d) result in stable scree slopes which are covered with top soil and landscaped to preserve and enhance the natural character or assist in the re-establishment of the natural character.

Council Wide Objective 11:

A comprehensive, integrated, and efficient, public and private transport system which will:

...

(c) ensure a high level of safety ...

Council Wide PDC 49:

Development should provide safe and convenient access for private cars, cyclists, pedestrians, service vehicles, emergency vehicles and public utility vehicles ...

Council Wide PDC 80:

Residential development should:

...

(d) provide for easy access for emergency and essential services vehicles ...

Council Wide PDC 82:

Residential development should minimize the potential for personal and property damage arising from natural hazards including landslip, bushfires, and flooding.

Council Wide PDC 201:

Development should be undertaken with the minimum effect on natural features, land adjoining water or scenic routes or scenically attractive areas ...

Council Wide PDC 202:

Natural vegetation should be preserved and replanting should take place.

Council Wide Objective 87:

The amenity of localities not impaired by the appearance of land, buildings and objects ...

Council Wide PDC 230:

Excavation and earthworks should take place in a manner that is not extensively visible from surrounding localities.

Council Wide Objective 107:

Development should minimise the threat and impact of bushfires on life and property while protecting the natural and rural character.

Council Wide PDC 300:

Buildings and structures should be located away from areas that pose an unacceptable bushfire risk as a result of one or more of the following:

(a) vegetation cover comprising trees and/or shrubs;

(b) poor access;

(c) rugged terrain;

(d) inability to provide an adequate building protection zone; or

(e) inability to provide an adequate supply of water for fire-fighting purposes.

Council Wide PDC 306:

Vehicle access and driveways to properties ... should be designed and constructed to:

(a) facilitate safe and effective operational use for fire-fighting and other emergency vehicles and residents ...

Council Wide PDC 337:

Development should be undertaken with the minimum adverse affect on the health of a significant tree.

Council Wide PDC 339:

Development involving ground work activities such as excavation, filling, and sealing of surrounding surfaces (whether such work takes place on the site of a significant tree or otherwise) should only be undertaken where the aesthetic appearance, health and integrity of a significant tree, including its root system, will not be adversely affected.

Zone PDC 2:

The excavation and/or filling of land should:

(a) be kept to a minimum so as to preserve the natural form of the land and the native vegetation;

(b) only be undertaken to reduce the visual impact of buildings, including structures, or to construct water storage facilities for use on the allotment;

(c) result in stable scree slopes which are covered with top soil and landscaped to preserve and enhance the natural character or assist in the re-establishment of the natural character.

Zone PDC 3:

Development should not be undertaken if the operation and management of such development is likely to result in:

(a) pollution of underground or surface water resources;

...

(d) unnecessary loss or damage to native vegetation including the full range of tree, understorey and groundcover species/native grasses so as to maintain and enhance environmental values and functions, including conservation, biodiversity and habitat;

...

(f) erosion;

...

(m) loss of amenity to adjoining land or surrounding localities from:

(i) the visual impact of buildings, structures or earthworks ...

ecological associates pty ltd

Project FO001-1-A

23 November 2017

Mark Musolino
2 Wilsden St
WALKERVILLE SA 5081

Dear Mark,

Assessment of Conservation Values and Vegetation Restoration at 28 Emmett Road Crafers West

INTRODUCTION

Ecological Associates was engaged by you to describe the conservation values, management issues and rehabilitation opportunities for an area of fill at 28 Emmett Road Crafers West.

I understand you intend to develop and rehabilitate the fill by:

- removing weeds from the batter slopes and surrounding area;
- establishing suitable native plants on the batter slopes; and
- providing vehicle access to the lower part of the block comprising a track cut into the batter slope with a turnaround area at the base.

The scope of this project was to:

- meet with you and inspect the site;
- describe the existing conservation values of the site and threats an opportunities presented by the fill and proposed works; and
- provide a report and recommendations.

I understand you have engaged a horticulturist to provide separate advice on vegetation design and establishment.

ECOLOGICAL SETTING

The site is located in Crafers West (836775.06, 6122000.07 MGA Zone 53) in Lot 100, Section P957, DP 63108 5917/721 in the Hundred of Adelaide. The site is in the Mount Lofty sub-region of the Flinders Lofty Block bioregion (IBRA 7.0) in the Adelaide Hills Council area.

The site is on the crest of a ridge between two deeply incised tributaries of Brown Hill Creek (Figure 1). Residential properties are developed along the ridge crest while the slopes and nearby hills support remnant native vegetation. The lower slopes of the Brownhill Creek have been cleared. Native vegetation in the area is *Eucalyptus* forest and woodland.

Mean annual rainfall at Belair (State Flora Nursery (1879 to 2017) is 779.3 mm (BOM data).

The closest protected areas are Cleland Conservation Park 500 m to the north east and Heritage Agreement 1086 560 m to the south west.

The site is not located in or near a wetland habitat.

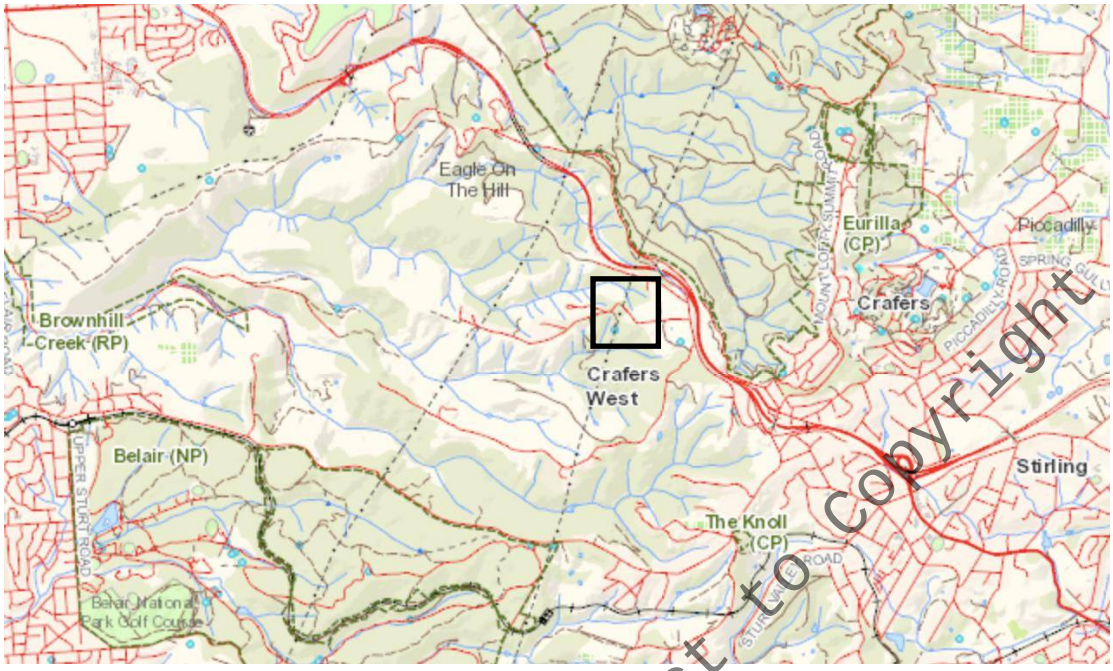

Figure 1. Site location

SITE DESCRIPTION

The site is a 1.3 ha residential property on a steep north-west facing slope. The property extends 310 m north from Emmett Road (Figure 2). The first 90 m of the property north of Emmett Road is a corridor as narrow as 13 m that broadens to over 60 m. The northern 0.9 ha of the block supports native vegetation. The house is located southern part of the block

The ground to the north of the house has been raised by importing fill. The fill has provided a relatively level area of 750 m^2 with a batter slope occupying a further 650 m^2. The fill has raised the surface by about 6 m at the highest point.

The fill was sourced from roadworks and construction projects and comprises clay, rock, concrete debris, bricks and bitumen. The surface of the fill is vegetated by mown grasses and herbs. The batter slope is vegetated by exotic shrubs, grasses and herbs.

Figure 2. Aerial image of 22 Emmett Road (C63108 A100) showing the house, area of fill adjacent to the house and native vegetation in the northern part of the property.

VEGETATION

The scrub at the foot of the slope is vegetated by *Eucalyptus obliqua* woodland with *Eucalyptus cosmophylla*. The mid-storey includes *Allocasuarina verticillata, Leptospermum myrsinoides* and *Exocarpos cupressiformis*. The ground layer includes *Hibbertia* spp., *Lepidosperma semiteres, Lomandra fibrata* and *Tetratheca pilosa*. Pest plants are present in the scrub including Radiata Pine, Boneseed and Cape Weed. An indicative species list is provided in Attachment 1.

The slopes of the fill support mainly exotic plants, including invasive pest species (Figure 2). Trees and shrubs include Radiata Pine, Euryops and Montpellier Broom. Herbs, forbs and grasses include Tangier Pea, Montpellier Broom, Watsonia, Fennel, Brome species, Kikuyu, Gallium and Blackberry.

The level surface of the fill is vegetated by mown grasses and herbs including Kikuyu, Plantago lanceolata, Hop Clover, Brome, *Vulpia*, Burr Clover, Capeweed, Fennel and Wild Barley (Figure 3).

Figure 2. Vegetation growing at edges and base of fill

Figure 3. Surface of the fill

THREATS AND OPPORTUNITIES

The native vegetation in the northern part of the property is largely intact with few signs of disturbance. The conservation value of the vegetation is increased by its continuity with native vegetation in neighbouring properties and the wider landscape. The vegetation is threatened by the invasive pest plants that have colonised the fill.

The slopes of the fill could be rehabilitated by removing the exotic vegetation and establishing local native plant species. The soil is of very poor quality and some treatment may required for successful revegetation to occur including the addition of top soil, watering and weed suppression.

It is recommended to plant hardy, fast-growing tussock grasses and rushes that will tolerate the soil conditions and help suppress weeds. Recommended species are:

- *Poa labillardieri var. labillardieri*
- *Juncus pallidus*
- *Juncus subsecundus*
- *Themeda triandra*
- *Enneapogon nigricans*
- *Austrostipa mollis*
- *Rytidosperma caespitosum*

All of these species are native to the local area. They grow in tussocks 0.3 to 1.5 m high, are drought tolerant and compete successfully with exotic plants.

After these plants are successfully established other species could be added including:

- *Dodoneaa viscosa*
- *Bursaria spinosa*
- *Eutaxia microphylla*
- *Acacia myrtifolia*
- *Leptosperumum myrsinoides*
- *Hakea carinata*
- *Acacia myrtifolia*

These species are local native shrubs 1 to 2 m high. They will suppress weed growth by reducing soil moisture and increasing shade.

It may be desirable to avoid using trees to preserve the view from the house. However if trees are planted suitable local species include:

- *Eucalyptus obliqua*
- *Eucalyptus cosmophylla*
- *Callitris preissii*
- *Acacia pycnantha*

The level surface of the fill will most likely be developed for lawn and garden plants. To prevent garden plants recolonising the batter slope it is recommended that a 1 m wide buffer of bare ground or wood chips is maintained at the top of the slope between the garden and native plantings.

It is recommended that pest plants are removed from the lower part of the property, particularly Euryops, Broom, Blackberry, Watsonia and Boneseed.

VEGETATION CLEARANCE FOR TRACK AND TURNAROUND AREA

The slope of the fill is very steep and does not provide safe access to the lower part of the property. It is proposed to cut a track in the northern edge of the fill and to clear a turnaround area at the base to provide foot and vehicle access.

The track will be constructed by cutting into the northern edge of the fill. Fill removed to cut the track should not contribute to further vegetation clearance. A vehicle turnaround area of up to 25 m^2 will be cleared from the native vegetation at the base of the slope.

The clearance of native vegetation is administered under the Native Vegetation Act. These works are likely be subject to the regulation for Vehicle Tracks, where a track may be cleared to establish or maintain a vehicle track that does not exceed 5 m in width, as long as the track is designed to avoid or minimise native vegetation impacts.

Clearing can proceed on the basis of a self-assessment by the landholder and a notification (email) to the Native Vegetation Council. The notification should provide the following information:

- applicant / landowner information;
- property details (section / hundred, allotment / plan);
- reason for clearance and how other alternatives for less or no clearance have been considered;
- map of clearance area / photographs; and
- description of vegetation.

Further information is available at:

http://www.environment.sa.gov.au/managing-natural-resources/native-vegetation/clearing/vehicle-track

COLLECTION OF FIREWOOD

The collection of firewood from native vegetation is regulated by the Native Vegetation Act.

The Act permits the collection of firewood from your own property in a way that allows for regrowth of cleared vegetation. Up to 6 cubic metres of firewood may be collected. Firewood can only be collected from plants with a stem diameter of 200 mm or less at a height 300 mm above the base of the plant.

Further information is available at:

https://www.environment.sa.gov.au/managing-natural-resources/native-vegetation/clearing/firewood

CONCLUSION

If you have any questions regarding this report or require further information, please do not hesitate to contact me.

Yours faithfully,

APPENDIX A. Indicative Species List

NATIVE SPECIES	
Scientific Name	**Common Name**
Acacia pycnantha	Golden Wattle
Allocasuarina verticillata	Drooping Sheoak
Arthropodium strictum	Common Vanilla-lily
Burchardia umbellata	Milkmaids
Eucalyptus cosmophylla	Cup Gum
Eucalyptus obliqua	Messmate Stringybark
Exocarpus cupressiformis	Native Cherry
Geranium potentilloides var. *potentilloides*	Downy Geranium
Goodenia blackiana	Native Primrose
Hakea carinata	Hakea
Hibbertia exutiaces	Guinea-flower
Hibbertia sericea	Silky Guinea-flower
Ixodia achilllaeoides ssp. *alata*	Hills Daisy
Lepidosperma semiteres	Wire Rapier-sedge
Leptospermum myrsinoides	Heath Tea-tree
Lomandra densiflora	Soft Tussock Mat-rush
Lomandra fibrata	Mount Lofty Mat-rush
Lomandra nana	Small Mat-rush
Pimelea stricta	Gaunt Riceflower
Sisymbrium erysimoides	Smooth Mustard
Stackhousia monogyna	Creamy Candles
Tetratheca pilosa	Hairy Pink-bells
Wahlenbergia multicaulis	Tadgells Bluebell

Tree Management Plan

Prepared by Gordon Sykes

Horticultural & Arboricultural Consultant

4 Hereford Lane, Woodcroft SA 5162

83818593 or 0448369565

gordon.sykes@bigpond.com

for

Mark Musolino
2 Wilsdon Street, Walkerville SA 5081

Site Address - 28 Emmett Road, Crafers West

Subject tree 1 - looking south-west.

Dear Mark

Thank you for meeting with me on Wednesday 23 July 2014 at 10.30 am and inviting me to prepare this Management Plan.

The purpose of this Management Plan is to provide an independent and qualified opinion on the health and safety of the trees and the effects that site filling may have had on the subject trees. This has been requested by the Adelaide Hills Council as soil been placed close to the trees trunks and over their root systems.

I have also recommended measures that would reduce any potential tree damaging activity caused by the placement of fill.

Regulated and Significant trees are protected under the Development Act 1993 and its regulations and as such removal or pruning of any tree including its root system is not permitted without authorization of the local council. This also applies to any works or changes to the site which may cause harm to regulated and significant trees and, as per the Native Vegetation Act, indigenous species.

Site tree species: *Eucalyptus leucoxylon subsp. leucoxylon* "SA Blue Gum" has a distribution throughout Kangaroo Island, most of the Mount Lofty Ranges and has scattered occurrences in the southern Flinders Ranges. This species is very common in the Crafers area.

SA Blue Gums can grow to heights of 30 metres with a canopy spread of 10 metre radius, the main stem has mostly smooth cream to tan bark with loose rough bark around the base that can extend along the main stem. The juvenile leaves are rounded and opposite without stems while the adult leaves are slightly glossy and green. The flowers vary in colour from cream to deep red with fruit capsules (gum nuts) shaped like a wine glass.

These trees provide habitat and are a food source for koalas and native birds.

Ref: Eucalyptus of South Australia – Dean Nicolle

****

Note: *SA Blue Gums have been used as street trees in many Council areas as they are drought tolerant when established and can withstand root damage with the construction of foot paths, kerbs and roads very close to their trunks. The species often causes concrete infrastructure to lift and crack and as such when repairs are made roots are severed close to the trees trunks with minimal harm to the stability and health of the tree.*

Tree Protection on Development Sites.

Trees can be damaged by any works associated with buildings, soil movement (excavations) and storage of materials. This was recognised and an Australian Standard was developed to provide guidelines that would assist developers and authorities in protecting trees during and after site works, the standard also provided methods that could be used to calculate radial distances from the centre of the subject tree near ground level.

This standard is known as AS4970-2009 Protection of trees on development sites.

The two (2) measurements associated with this Australian Standard are;

- **Structural Root Zone (SRZ)** which is the area around the base of a tree required for the tree's stability in the ground. The woody root growth and soil cohesion in this area are necessary to hold the tree upright. The SRZ is normally circular with the trunk at its centre and is expressed by its radius in metres.

- **Tree Protection Zone (TPZ)** is a specified area above and below ground and at a given distance from the trunk set aside for the protection of a tree's roots and crown to provide for the viability and stability of a tree to be retained where its is potentially subject to damage by development.

SRZ radius is calculated by the formula $(D \times 50)^{0.42} \times 0.64$ - D being the diameter of the trees base.

TPZ radius is calculated by the formula Diameter at Breast Height (DBH 1.4 metres) x 12. The TPZ radius for multiple trunked trees uses the formula $\sqrt{(DBH)^2 + (DBH)^2 + (DBH)^2} \times 12$

The site 28 Emmett Road, Crafers West.

As advised by your self clean soil has been dumped and spread on the site to the north and western sides of the existing dwelling to create a more level area. This soil has been pushed beneath the canopies and close to the trunks of three (3) *Eucalyptus leucoxylon subsp. leucoxylon* "SA Blue Gums".

These trees remain healthy and vigorous and have not suffered any structural damage to their trunks or branches. However there has been encroachment into both the SRZ and the TPZ which has reduced the aerobic activity of the soil by compaction and has the potential to cause 'collar rot' to the lower trunks of these trees.

This potential damage can be rectified by carefully removing the introduced soil from the entire SRZ and parts of the TPZ.

Western side from dwelling tree: The SA Blue Gum shown as the image on the front page of this document is classified as a "significant" tree as the total of its three trunks is 4.35 metres.

This image shows the lower trunk (looking south) and where the three trunks divide into tri-dominant first order branches.

The unions are sound and there is only a build of loose bark which should not be a concern.

The image also shows the build up of soil near the trees lower trunk.

This tree is in good condition and has an estimated height of 18 metres with a generally symmetrical crown spread of 8 metres radius.

As this tree is significant I considered it appropriate to use the measurements from AS4970-2009 and to use these measurements to recommend how mush of the fill should be removed.

The Base Diameter (BD) of this tree is 0.85 metres and the Diameters at Breast Height (DBH) are 0.44 metres, 0.43 metres and 0.50 metres.

SRZ radius = $(0.85 \times 50)^{0.42} \times 0.64 = 3.10$ metres – this area must not be encroached and all fill soil is to be removed to this radius.

TPZ radius = $\sqrt{(0.44)^2 + (0.43)^2 + (0.50)^2} \times 12 = 9.50$ metres. The soil on the trees eastern side should be further removed back to natural ground level for a distance of 6 metres from the trees trunk centre.

The remaining soil should be battered back at an appropriate angle to direct rain water run off evenly to the trees TPZ area.

The work should be undertaken by experienced operators of a light weight excavator and at no time should this machine enter the SRZ, it is also recommended that soil removal around the trees trunk be manually undertaken to avoid any off target damage to the tree.

This work should be completed before the end of September 2014 which would be just prior to new spring growth.

Northern side fill embankment:

This image shows two other SA Blue Gums which are not classified as 'regulated' or 'significant'.

These trees are in good health although one does have a distinct lean to the north-west.

Fill has been pushed to the trunks of both these trees and it is evident that the SRZ and TPZ have been encroached by this fill.

This image show that recent rain events have washed a lot of the fill away from the trees and it is quite clear what is filling and what is natural ground.

The fill is mainly on the southern sides of these trees and spills to the east and west.

Recommendation: That an excavator with a suitable length reach is used to remove all the fill to the southern drip-line of these trees (about 5 metres), work near the trees trunks should be manual to prevent any machinery damage to the trees trunks.

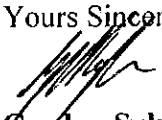
The removed fill should not be transferred to another area where trees may be affected but it could be placed at the top of the embankment in low mounds which would direct rain water run off evenly over the embankment.

Some of this fill could also be used to fill an area that has eroded with the recent rains

Note: On the northern side of the property I did observe that a number of *Eucalyptus oblique* "Messmate Stringy Barks" have died, close inspection identified that the deaths have been caused by infestations of the larvae of the longicorn beetles (borers), this cannot be avoided but is a seasonal occurrence and many trees will survive and others germinate.

Thank you for the opportunity to provide this report and I trust it meets your requirements and provides sufficient information to protect the site trees from damage.

Yours Sincerely



Gordon Sykes

Approximate fill thickness contours are based on regional topographc contours compared with recent survey data. Accuracy is dependent on the two datasets compared and some spatial and vertical discprency with observed fill thickness is to be expected. The recent fill thickness aims to omit previous land filling completed during house construction, therefore total fill thickness nearer the dwelling will be thicker.

EXECUTIVE SUMMARY

Mud Environmental has undertaken an environmental soil investigation at 28 Emmett Road, Crafers West, South Australia ('the site').

Between approximately 2009-2013, part of the site was filled with imported soils from unknown source(s). As outlined in the letter of instruction from Botten Levinson Lawyers, Adelaide Hills Council has requested information from the landowner regarding the contamination status of the fill as part of Development Application 13/30/473. In accordance with the letter of instruction, the objectives of the investigation were to:

1. Confirm that the fill placed on the site is suitable for residential purposes, including the private open space associated with the dwelling;
2. Confirm that there is no risk of pollution to surface or underground waters from the fill; and
3. Ascertain (and plot) the pre 2010 landform, the existing landform including the in-situ fill materials, and the final form of the land as per the proposed site redevelopment plans included within the Development Application.

Eleven test pits were excavated across the inferred filled area at the site. The materials encountered were logged and sampled for laboratory testing and screened in the field for volatile contaminants as well as visual / olfactory indicators of potential contamination. Pre- and post-filling survey data was interrogated using GIS to assess the likely location and depth of fill.

In relation to the stated objectives above, the findings of the investigation are:

1. **Suitability of fill for residential and private open space uses:**

    a. The materials encountered in the filled area are heterogenous, with various layers of fill materials and natural soils observed within the test pits excavated across the inferred filled area at the site.
    b. The depth of fill materials ranged between 0.5m and 3.8m depth below the current surface, with underlying natural soils confirmed at all test pit locations except for test pit TP07, where fill materials were present to the maximum depth of investigation of 3.3m.
    c. Photoionisation detector (PID) results were recorded up to a maximum of 0.3ppm, indicating that the potential for volatile contaminants was low.
    d. In addition to the soil materials, non-mineralogical inclusions were observed within most fill layers, primarily in the form of construction and demolition materials including concrete, bitumen, bricks, pavers, ceramic tiles, plastic sheeting and PVC pipe. Trace inclusions of tar, ash, cinders and slag were observed at some locations.
    e. Asbestos containing materials (ACMs) were confirmed in the form of grey fibre cement fragments within test pit TP07 at depths of between 1.9m-2.7m (FILL 7 layer). No other potential ACMs were encountered in any of the other test pits excavated at the site.
    f. No significant indicators of potential contamination (i.e. odours, staining) were observed during test pitting or soil sampling activities.
    g. All results were below the adopted Tier 1 health based and ecological screening levels for residential land use, except for two individual benzo(a)pyrene concentrations in near surface soils (0.1-0.2m) at locations TP3 and TP6. A Tier 2 risk assessment comprising statistical assessment and review of toxicological data for benzo(a)pyrene was undertaken, which confirmed that these concentrations do not present a risk to human health or ecological risk in the context of residential use. On this basis, the fill materials are not considered to present an unacceptable risk to human health or the environment in the context of residential land use, including private open space areas.

2. **Risk to surface or underground waters from the fill:**

    a. No significant soil concentrations were identified in soils at the site that are considered to threaten surface or groundwater. As stated in the ASC NEPM, '*Groundwater protection may be a particular concern where contamination occurs in sandy soils containing naturally low levels of organic matter, clay and trace elements. In most situations, soil contaminants at levels below appropriate EILs or HILs do not pose a threat to local groundwater sources.*' On this basis, no risk to surface or underground waters has been identified.

3. **Pre- and post-filling levels and depth of fill:**

    a. **Figure 2** shows the pre- and post-filling contours in relation to site features.
    b. **Figure 3** shows the inferred depth of fill based on the difference between these two surveys, which was confirmed through the test pit investigations. The depth of fill ranges from 0m to approximately 5m in the central part of the allotment to the north of the current dwelling.

The following recommendations are made:

- Any soil imported to the site should be sourced from a commercial supplier where possible. Should waste soils be generated from another site to be imported to the site, then the soils should be classified and imported in accordance with EPA requirements.
- All surplus soils to be removed from the site must be managed in accordance with relevant EPA guidelines and/or requirements of waste or recycling depots authorised by the EPA.
- Construction and demolition waste materials should be disposed off-site in accordance with the requirements of waste or recycling depots authorised by the EPA.
- Should any unforeseen materials (including asbestos containing materials) be identified during any excavation works and /or soil handling and management activities, it is recommended that these soils are quarantined, and further advice is sought from an appropriately qualified environmental consultant.

This report and the opinions expressed above are subject to the limitations presented in **Section 5**. It is important that the reader make themselves aware of these limitations.

TABLE OF CONTENTS

TABLES

APPENDICES

1 INTRODUCTION

Mud Environmental was engaged by Botten Levinson Lawyers ('BLL') to undertake an Environmental Soil Investigation at 28 Emmett Road, Crafers West, South Australia ('the site'). The site location and layout are shown on **Figure 1** in **Appendix A**.

Between approximately 2009-2013, part of the site was filled with imported soils from unknown source(s). As outlined in the letter of instruction from BLL (refer **Appendix B**), Adelaide Hills Council ('Council') has requested information from the landowner regarding the contamination status of the fill as part of Development Application 13/30/473.

1.1 Objectives

As outlined in the letter of instruction, the objectives of the investigation were to:

- Confirm that the fill placed on the site is suitable for residential purposes, including the private open space associated with the dwelling;
- Confirm that there is no risk of pollution to surface or underground waters from the fill; and
- Ascertain (and plot) the pre 2010 landform, the existing landform including the in-situ fill materials, and the final form of the land as per the proposed site redevelopment plans included within the Development Application.

2 BACKGROUND

2.1 Site Details

Site details are presented in **Table 1** below.

Table 1 – Site Details

Category	Details
Street Address	28 Emmett Road, Crafers West, South Australia
Certificate of Title	Certificate of Title Volume 5917 Folio 721 Allotment 100 Deposited Plan 63108 in the Area named Crafers West Hundred of Adelaide A copy of Property Location Browser map report identifying the street address and land parcel associated with the above Certificate of Title is provided in **Appendix C**.
Owner(s)	Mr Mark Musolino
Area of Site	Approximately 13,300 m² (1.33 hectares)
Municipality	Adelaide Hills Council
Zoning	The site is zoned Hills Face Zone (HF). The objectives of the Hills Face Zone include: ▪ A zone in which the natural character is preserved and enhanced or in which a natural character is re-established in order to: ▪ (a) provide a natural backdrop to the Adelaide Plain and a contrast to the urban area; ▪ (b) preserve and develop native vegetation and fauna habitats close to metropolitan Adelaide; ▪ (c) provide for passive recreation in an area of natural character close to the metropolitan area; ▪ (d) provide a part of the buffer area between metropolitan districts and prevent the urban area extending into the western slopes of the Mount Lofty Ranges; and ▪ (e) ensure that the community is not required to bear the cost of providing services to land within the zone. ▪ A zone accommodating low intensity agricultural activities and public/private open space and one where structures are located and designed in such a way as to: ▪ (a) preserve and enhance the natural character or assist in the re-establishment of a natural character in the zone; ▪ (b) limit the visual intrusion of development in the zone, particularly when viewed from roads within the zone or from the Adelaide Plain; ▪ (c) not create, either in themselves, or in association with other developments, a potential demand for the provision of services at a cost to the community; and ▪ (d) prevent the loss of life and property resulting from bushfires.
Current Use	The site is used for residential purposes but is currently unoccupied. Architectural drawings of the current residence are included in **Appendix D**.
Proposed Future Use	It is understood that the site will be redeveloped for residential use.
Surrounding Land Use	▪ North - Vacant undeveloped woodland, residential properties (~150m away), then the South Eastern Freeway ▪ East - Vacant undeveloped woodland, residential properties (~100m away), then the South Eastern Freeway ▪ South - Emmett Road, followed by residential properties then vacant undeveloped hills face woodland ▪ West - Residential property, beyond which is Emmett Road, then residential properties and vacant woodland

2.2 Environmental Setting

A summary of the environmental setting of the site and surrounds is provided in **Table 2** overleaf.

2.3 Historical Information

Based on information provided by BLL and discussions with the site owner, it is understood that:

- The existing dwelling was constructed in approximately 1973 (refer to original architectural drawings in **Appendix D,** which also show the pre-filling contours). Prior to fill importation in 2009, the rear yard immediately to the north-west of the residential building was roughly flat until just past the septic tank, an approximate distance of 9m from the rear of the building (shown as a green shaded area on **Figure 1** in **Appendix A**).
- Fill materials were imported to the site between approximately 2009 and 2013. The materials were provided by a civil earthworks contractor as 'clean fill' from multiple unknown sources. Photographs from 2004 (pre-filling) and 2013 (post-filling) are included in **Appendix F.** A survey plan showing the current surface contours is included in **Appendix G**.
- In 2018 an excavator was used on-site to undertake the following minor earthworks:
  - Excavate an area along the western side of the driveway (south of the residential building) to create a flat area for a future shed; and
  - Create a fire access track immediately to the north of the residential building.

Table 2 – Topography, Geology + Hydrogeology

Information	Source	Why this is useful?	Site specific information
Topography + Drainage + Surface Waters	Site Inspection	Topography and drainage provide an indication of the likely direction of movement of surface and subsurface contamination, especially in respect to any nearby sensitive human or ecological receptors.	The site slopes relatively gently to the north from Emmett Road along the southern site boundary and towards central portion of the site, where the site gradient reduces to relatively flat immediately around the existing residential building. The relatively flat rear yard on the northern side the building extends approximately 20m to the north and north-west, beyond which a steep gradient exists over a distance of approximately 20m further to the north and north-west as a result of the extensive importation of fill materials in this area of the site, and which have formed a resulting steep batter slope towards in this area of the site. A slight to moderate site gradient continues towards the north all the way to the northern site boundary. Surface elevation adjacent the residential dwelling is 550m Australian Height Datum (mAHD). The soil investigation area consists entirely of unsealed open spaces consisting of relatively flat to quite steep surface gradients. Rainfall is expected to infiltrate directly into site soils initially, with any surface water runoff expected to migrate down-topographic gradient in a general north-westerly direction, and into the local gully formations approximately 250m away which drain into the Brownhill Creek watercourse system located to the south-west of the site. The marine ecosystems of the Gulf of St. Vincent are located approximately 16km to the west of the site. Site topographic features are illustrated on **Figure 2 and Figure 3** in **Appendix A**. Site photographs showing localised topographic features are included in **Appendix E** (photographs 1 to 9).
	South Australian Resources Information Geoserver Database (SARIG)		
	Naturemaps		
	Adelaide Topographic Map 1:2,500 series, (Sheet 6628-49-h) Department of Lands, South Australia 2nd Edition, 1982		
	Site Levels & Contour Plan (4 October 2012) Olden and van Senden Pty Ltd, Surveying and Planning Consultants		
Regional Geology	1:250,000 Adelaide Geological Map Geological Survey of South Australia, Department of Mines Adelaide, 1st Edition, 1969	The geological conditions at a site help understand how contamination moves in the environment, particularly risks to groundwater associated with surface releases or contamination issues.	The surface geology beneath the site is comprised of flaggy feldspathic Undalya Quartzite (Stonyfell Quartzite), comprising of unnamed siltstone members. Underlying geological formations include various shales, sandstones and dolomite beds, subsequently underlain by the Barossa Complex which consists mica-quartz schists, granitic gneiss, granite, metaquartzite and albitized zones.
	SARIG Database		The site is in an area characterised by the *Stonyfell Quartzite which* consists of flaggy to medium-bedded, pale grey, feldspathic quartzite, of fine to coarse grain.
	Soil Association Map of the Adelaide Region (Sheard & Bowman, 1972)		The site is located approximately 5 kilometres to the south-east of the Eden-Burnside Fault, with very thin surficial soils described as skeletal soils (SK) which exist on bedrock, in conjunction with rock outcrops in general.
	CSIRO ASRIS Acid Sulphate Soils Map		The site is located in an area of extremely low probability / very low confidence of acid sulphate soils.
Hydrogeology + Groundwater Resources	DWLBC Report (2006) '*Overview of the hydrogeology of the Adelaide metropolitan area*'	Hydrogeological information includes an assessment of the likely depth to groundwater and the corresponding water quality. This	The site is located to the east of the Eden-Burnside Fault within Hydrogeological Zone 2, which contains from two to four Quaternary aquifers and from two to four Tertiary aquifers. Only the T1 Aquifer is used significantly as it consists mainly of highly permeable formations (sandy limestone), with groundwater salinity expected to generally range between less than 500mg/L up to 1,500mg/L.

Information	Source	Why this is useful?	Site specific information
	Department of Water (DEW) WaterConnect Database	information assists with the determination of the risk to ground or surface water and the likely impact this may have on its beneficial use.	A search of licensed groundwater wells within a 1km radius of the site was undertaken, with a total of 33 registered bores identified at the locations shown on the plan included in **Appendix H**. Of the 33 registered wells identified, a total of 22 wells were installed to depths of 20m or greater, which suggests that they were installed into deeper aquifers, while four wells did not have depth information recorded. The 33 registered wells returned standing water level (SWL) measurements of between 6.71m and 85m (11 out of 33 wells had SWL information recorded). Total dissolved solids (TDS, or salinity) concentrations were reported at a total of 10 out of 33 wells, with TDS concentrations ranging between 157mg/L and 1,244mg/L, indicating that groundwater in the vicinity of the site is of low salinity. The EPA (2019) *Guidelines for the Assessment and Remediation of Site Contamination* considers that groundwater with a TDS concentration of less than 1,200 mg/L is suitable as a potential drinking water supply. A total of 9 out of 10 registered wells (where TDS data was available) recorded TDS values of less than 1,200 mg/L (average of 597mg/L). While only nine out of 33 registered wells reported purpose information, five of these wells are listed as being used for domestic purposes (1 x operational, 1 x backfilled, 1 x abandoned, 2 x unknown status). One well is also listed as being used for irrigation purposes (operational status). The information obtained from the WaterConnect database indicated that no registered wells exist on-site. A total of seven registered bores were identified within 200m of the site, and are summarised as follows: ▪ **6628-7334** (~500m to the south-east): Unknown purpose, installed to 9.75m depth, SWL of 6.71m, TDS value of 157 mg/L (measured 1936), abandoned. ▪ **6628-21659** (~150m to the east): Domestic well, installed to 91m depth, SWL of 30m, TDS value of 1,244mg/L, yield recorded at 0.56L/sec, backfilled. ▪ **6628-21660** (~170m to the east): Domestic well, installed to 49m depth, SWL of 25m, TDS value of 827mg/L, yield recorded at 1.13L/sec, status unknown. ▪ **6628-19609** (~450m to the east): Domestic well, installed to 189m depth, no SWL / TDS / yield /status information available. ▪ **6628-7330** (~200m to the north-east): Unknown purpose, installed to 60m depth, no SWL / TDS / yield / status information available. ▪ **6628-23612** (~400m to the north): Unknown purpose, installed to 147m depth, no SWL / TDS / yield / status information available. ▪ **6628-7328** (~200m to the north-west): Unknown purpose, installed to 3.05m depth, TDS value of 714mg/L, no SWL / yield / status information available.

3 ENVIRONMENTAL SOIL INVESTIGATIONS

3.1 General Methodology

The main guideline documents referenced as part of this investigation were:

1. EPA '*Guidelines for the assessment and remediation of site contamination'* updated November 2019, herein referred to as the 'GAR, 2019';
2. *National Environment Protection (Assessment of Site Contamination) Measure, 1999 as amended 2013* (ASC NEPM, 2013); and
3. Australian Standard AS4482.1-2005 *Guide to the investigation and sampling of sites with potentially contaminated soil, Part 1: Non-volatile and semi-volatile compounds*'.

The environmental soil investigations were limited to sampling and testing of the fill materials to assess the specific objectives presented in **Section 1.1**.

As required by the GAR, completed *Honesty in reporting* forms are included in **Appendix N**.

3.2 Scope of Work

The following table details the scope of works and associated field methodologies completed as part of the soil investigations undertaken at the site.

The locations of all test pits excavated at the site are illustrated on **Figure 3** in **Appendix A**.

Table 3 – Summary of Investigations

Activity	Item	Description
Site Walkover + Services Clearance	Date	14 October 2019
	Methodology	A review of site conditions was conducted via a thorough walkover of the site. Prior to any ground-breaking activities, all proposed test pit locations were cleared of underground and overhead services via the following methodology: ▪ Review of available Dial Before You Dig (DBYD) services plans. ▪ Inspection of the site and immediate off-site areas for potential evidence of utility services e.g. inspection points, cuts in concrete, signage. ▪ Engagement of an experienced professional service detection contractor (Pipeline Technologies) to clear each of the proposed test pit locations using radio detection and ground penetrating radar (GPR) equipment.
Test Pitting	Date	28 October 2019
	Methodology	Excavation of 11 test pits (TP1 to TP11) was completed across the site, with soil samples collected at approximately 0.5m intervals and from each distinct layer of lithology encountered. Soil logging was consistent with *AS 1726-1993: Geotechnical Site Investigations* and the *Unified Soil Classification System (USCS).* A total of 56 primary soil samples were collected, with 22 primary soil samples submitted for laboratory analyses for a range of chemical substances potentially associated with fill materials as follows: ▪ 23 x samples were submitted for pH; ▪ 21 x samples were submitted for PAHs; ▪ 19 x samples were submitted for metals and OCPs; ▪ 13 x samples were submitted for metals and OPPs; ▪ 6 x samples were submitted for TRH and BTEX; and ▪ 1 x sample was submitted for a SA Waste Screen. In addition, one sample of potential asbestos contain materials in the form of a fibre cement fragment was submitted for the presence / absence of asbestos. A calibrated photo-ionisation detector (PID) was used to screen all soil samples collected in the field for the presence of volatile organic compounds (VOCs). Soil sub-samples were placed into zip-lock bags and the headspace allowed to equilibrate for approximately 2 minutes in a shady area. The PID vacuum inlet was then placed within the bag headspace to measure semi-quantitative VOC concentrations. The PID calibration certificate is provided in **Appendix I**.

Activity	Item	Description
Avoidance of Cross Contamination	Date	28 October 2019
	Soil Sampling	Measures incorporated to prevent cross contamination during soil sampling activities included: ▪ Collection of samples directly from the excavator bucket. ▪ All samples were collected with new disposable nitrile gloves for each sample to avoid cross contamination. ▪ Only dedicated sampling equipment was used during the collection of soil samples thereby minimising the potential for cross contamination during sample handling.
Sample Handling and Preservation	Date	28 October 2019
	Procedures	Samples were stored in a cooler box containing ice with an accompanying chain of custody (COC) document during transit to the laboratories. Sample transportation and handling information are provided on the COC summaries provided in **Appendix L**.

3.3 Tier 1 Investigation / Screening Levels

To assess the significance of soil analytical results in relation to human health and environmental risks, concentrations of chemicals of concern were compared to the adopted health and environmental assessment criteria as outlined in the ASC NEPM.

The ASC NEPM states that site screening criteria are not clean up or response levels, nor are they desirable soil quality criteria. They are to be used for the assessment of existing contamination only and are intended to prompt an appropriate site specific response when exceeded. Site specific health and ecological risk assessments must be conducted where exceedances of investigation levels indicate that there is a likelihood of adverse effects on human health or ecological values for a site.

As the proposed ongoing use of the land is for residential purposes, the following site suitability land use scenarios have been considered:

- Residential with gardens / accessible soils (i.e. low density residential); and
- Public open space such as parks and playgrounds (e.g. recreational use).

On the basis of these identified land uses, the investigation / screening levels highlighted below in **Table 4** were adopted for assessing the significance of chemical concentrations in soils at the site.

Table 4 – ASC NEPM Site Suitability Investigation / Screening Levels

Land Use	HILs		HSLs		EILs	ESLs	Management Limits	Aesthetics
	HIL A	HIL C	HSL A/B	HSL C	Urban Residential + Public Open Space		Fine & Coarse Soil	Visual + Olfactory
Residential with gardens and access to soils	✓		✓		✓	✓	✓	✓
Public open space		✓		✓	✓	✓	✓	✓

The various human health and ecological investigation / screening levels are discussed further below.

3.3.1 Protection of Human Health

The following investigation / screening levels were adopted to assess potential risks to human health from soils.

Table 5 – Soil Investigation / Screening Levels for the Protection of Human Health

Reference	Category	Discussion
ASC NEPM Health Investigation Levels (HILs)	HIL A - Residential with garden / accessible soil HIL C - Public open space	Health Investigation Levels (HILs) have been developed for a broad range of metals and organic substances and are based on generally conservative assumptions for the estimated exposure of occupiers in a variety of exposure settings including residential, public open space and commercial / industrial land uses. The HILs are applicable for assessing human health risk via all relevant pathways of exposure and are generic to all soil types. The ASC NEPM states that '*An investigation level is the concentration of a contaminant above which further appropriate investigation and evaluation will be required (ANZECC/NHMRC Guidelines 1992)*'. Therefore, an exceedance of an investigation level does not indicate that there is a definite risk to human health, but rather that further site-specific assessment is required to quantify the potential risk to human health. Soil results have therefore been compared to the following HILs: ▪ HIL A – residential with garden/accessible soil (home grown produce <10% fruit and vegetable intake (no poultry)) in the first instance as the most conservative measure; and ▪ HIL C – Public open space such as parks, playgrounds and playing fields (e.g. ovals), secondary schools and footpaths. It is considered that the adoption of the most sensitive health-based screening level (i.e. HIL A) is also protective of other sensitive receptors, including childcare / school users, recreational users, commercial / industrial users and construction and maintenance workers.
ASC NEPM Health Screening Levels (HSLs)	HSL A + B Low-high density residential	Health Screening Levels (HSLs) have been developed for selected petroleum compounds and fractions. They are applicable to assessing human health risk via the inhalation of soil vapours. The HSLs depend upon specific soil physiochemical properties, land use scenarios and the characteristics of building structures. They apply to different soils types, and varying depths below the surface. In the first instance, the conservative HSLs for exposure setting HSL A/B (low-high density residential) for sandy soils (0-2m) have been selected, which are also considered protective of other less sensitive users. However, comparison to adopted HSLs A/B for both silt and clay materials has also been undertaken given the observed presence of these soils within the sub-surface.
Schedules B(1) and B(2) of the ASC NEPM	Health screening levels for asbestos	Health screening levels for asbestos are presented in the ASC NEPM for bonded asbestos and friable asbestos in soil, which are based on scenario specific likely exposure levels, and are adopted from the Department of Health (WA) '*Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia'* dated May 2009.

3.3.2 Protection of the Environment

The following investigation / screening levels were adopted to assess risks to ecological receptors from soils.

Table 6 – Soil Investigation / Screening Levels for the Protection of the Environment

Reference	Category	Discussion
ASC NEPM Ecological Investigation Levels (EILs)	Urban residential / public open space	The ASC NEPM provides ecological investigation levels (EILs) to assess the potential risk posed to ecological receptors. The EILs have been developed for selected metals and organic substances, are applicable for assessing risks to terrestrial ecosystems, and depend on specific soil physiochemical properties and land use scenarios which generally apply to the top 2m of soil. The NEPM specifies the following ecologically based investigation levels: ▪ Default EILs for arsenic, lead, DDT and naphthalene. ▪ Derivation of site-specific EILs for nickel, chromium III, copper and zinc. Based upon the land use of the site and surrounding area, the EILs for the generic land use setting (urban residential and public open space) have been used. A method is provided for deriving site specific EILs for copper,

Reference	Category	Discussion
		chromium III, nickel and zinc. This requires an assessment of the ambient background concentration (ABC) for the relevant soil, by applicable measurements of uncontaminated soils either on site or in the broader locality. The EIL is then derived from the sum of the ambient background concentration (ABC) and the added contaminant limit (ACL). The ACL's are listed in the current version of the ASC NEPM for chromium III and nickel (based on clay content), copper (based on the cation exchange capacity and pH of the soil), and for lead (generic ACL irrespective of soil properties). As site-specific soil characteristics of pH, CEC and clay content were not directly measured during soil investigations, the ACLs calculated for the site are based on the average pH values across all soil samples tested (n=22) and by applying highly conservative values for cation exchange capacity (CEC = 5 cmolc/kg dwt) and clay content (1%). In addition, the ABCs for copper, chromium III, nickel and zinc were calculated using the average concentrations from all soil samples analysed (n=20). Site-specific EILs were then calculated for based on this conservation approach to the derivation ABCs and ACLs. Assumptions used in the EIL calculations are presented in **Appendix K**.
ASC NEPM Ecological Screening Levels (ESLs)	Urban residential / public open space	Ecological Screening Levels (ESLs) have been developed for the management of potential risk posed by selected petroleum hydrocarbons. The ESLs broadly apply to coarse and fine-grained soils and various land uses. They are generally applicable to the top 2m of soil. Based upon the land use of the site and surrounding area, the criteria for the generic land use setting (urban residential and public open space) for coarse soils have been used. There are ESLs listed in the current version of the ASC NEPM for petroleum hydrocarbon compounds including BTEX, benzo(a)pyrene, C6-C10 TPH (total TPH in this fraction minus total BTEX), and C10-C16 TPH (total TPH in this fraction minus naphthalene).
ASC NEPM Management Limits	Management Limits (fine and coarse soils)	Petroleum hydrocarbon 'Management Limits' criteria are limited to petroleum hydrocarbon compounds, and are maximum values that should remain at a site following evaluation of potential human health and ecological risks, and potential risks to groundwater resources. The Management Limits apply to all soil depths based on site-specific considerations, and also consider the formation of light non-aqueous phase liquids, fire and explosion risks, and damage to buried infrastructure.

3.3.3 Buildings and Structures

For some substances, such as phenols and sulphates, their impact on structures (effects on PVC piping and cement) may override the health and environmental considerations. As outlined in the ASC NEPM (2013), a structural limit of 2,000 mg/kg is set for sulphate in soil.

Australian Standard AS 2159 (1995) *Piling – Design and Installation* provides exposure classification values for concrete and steel piles in soil (non-aggressive to very severely aggressive). These guidelines are considered to be appropriate in assessing the potential for detrimental impacts of site soils to buildings and structures.

In addition, the presence of other aggressive chemical compounds (e.g. acids) may be potentially detrimental to buildings or structures and pH of site soils has been considered in this context.

The ASC NEPM (2013) Management Limits also consider damage to buried infrastructure from petroleum hydrocarbons in soils.

3.3.4 Aesthetics

Relevant SA EPA and ASC NEPM guidance material requires that potential aesthetic issues must be considered in the site contamination assessment process, and defines aesthetic issues as those that generally relate to the presence of non-hazardous inert foreign material.

The presence of these materials alone at a site would not generally result in site contamination, however, sites that may have been adequately assessed and/or remediated to address potential human health and environmental issues arising from site contamination may still contain residual foreign inert materials that require management.

The aesthetic suitability of the soil materials encountered was therefore considered against the definition of contamination as outlined in the ASC NEPM (2013), which states that:

> *'In arriving at a balanced assessment, the presence of small quantities of non-hazardous inert material and low odour residue (for example, weak petroleum hydrocarbon odours) that will decrease over time should not be a cause of concern or limit the use of a site in most circumstances. Similarly, sites with large quantities of well-covered known inert materials that present no health hazard such as brick fragments and cement wastes (for example, broken cement blocks) are usually of low concern for both non-sensitive and sensitive land uses. Caution should be used for assessing sensitive land uses, such as residential, when large quantities of various fill types and demolition rubble are present.'*

Apart from the typical inclusions of construction and demolition materials, the following characteristics are examples of other aesthetic concerns:

- Highly malodorous soils or extracted groundwater (e.g. residual petroleum hydrocarbons, hydrogen sulphide, organosulfur compounds);
- Hydrocarbon sheen on surface water;
- Discoloured chemical deposits or soil staining with chemical waste other than of a very minor nature;
- Large monolithic deposits of otherwise low-risk material, e.g. gypsum as powder or plasterboard, cement kiln dust;
- The presence of putrescible refuse materials that may generate hazardous levels of methane (e.g. a deep-fill profile of green waste or large quantities of timber waste; and/or
- Soils containing residue from animal burial (e.g. former abattoir sites).

There are no specific numeric aesthetic guidelines, however site assessment requires balanced consideration of the quantity, type and distribution of foreign material or odours in relation to the specific land use and its sensitivity. For example, higher expectations for soil quality would apply to residential properties with gardens compared with industrial settings.

In some cases, documentation of the nature and distribution of the foreign material may be sufficient to address concerns relating to potential land use restrictions.

3.4 Results

3.4.1 Review of Survey Data + Fill Depths

Figure 2 shows the pre- and post-filling contours in relation to site features. Whilst design elevations are not available for the proposed future dwelling, it is understood that the elevation of the home will remain similar to the current surface.

Figure 3 shows the inferred depth of fill based on the difference between these two surveys, which was confirmed through the test pit investigations. The depth of fill ranges from 0m to approximately 5m in the central part of the allotment to the north of the current dwelling.

3.4.2 Materials Encountered + Field Observations

Photographs of soil materials encountered with soil bores are provided in **Appendix E** (photographs 10 to 36). Test pit logs are provided in **Appendix J**.

A general summary of the soil materials encountered is provided in the table below.

Table 7 – Materials Encountered

Layer	Description
FILL 1	SAND, silty, fine to coarse grained, gravelly, orange-brown to light brown, dry to low moisture, trace oversized (>100mm) mudstone / siltstone cobbles up to 100mm, **trace inclusions of combinations of bitumen / paving bricks / red bricks / concrete fragments / ash + cinders / ceramic tiles / black or orange plastic / PVC pipe** (possibly from adjacent building structure).
FILL 2	GRAVEL, sandy, blue-grey sub-base materials, angular gravels to 50mm, moist.
FILL 3	SAND, silty, fine to medium grained, orange, moist (sandy loam type soils).
FILL 4	CLAY, sandy, gravelly, medium plasticity, brown to dark brown, **trace oversized (>100mm) inclusions of combinations of bitumen / paving bricks / cinders / slag / red brick fragments,** moist.
FILL 5	CLAY, sandy (coarse grained), gravelly, low plasticity, light-brown to brown, **trace bitumen pieces up to 250mm, ultra-trace concrete pieces / bituminous tar, moist.**
FILL 6	CLAY, silty, low-plasticity, orange-brown to red-brown, trace calcareous gravels up to 50mm, trace whole quartz gravels to 50mm, **trace bitumen.**
FILL 7	CLAY, sandy, gravelly, low plasticity, brown, **trace oversized (>100mm) bitumen / concrete fragments, potential ACM fragments**
FILL 8	CLAY, sandy, gravelly, low plasticity, brown, **trace inclusions of combinations of bitumen / concrete / paving bricks / quartz cobble ballast up to 100mm**, moist.
FILL 9	SAND, gravelly, clayey, **trace oversized concrete / bitumen / trace steel reo**, light brown to brown, moist.
FILL 10	CLAY, silty, trace gravels, medium plasticity, red-brown, **trace oversized (>100mm) fragments of brick / pavers / concrete / bitumen.**
FILL 11	SAND, clayey, coarse grained, orange-brown, trace gravels and cobbles throughout up to 150mm.
NATURAL 1	CLAY, silty, low plasticity, trace mudstone cobbles and gravels from 10mm-300mm, orange-brown to brown, moist.
NATURAL 2	SILT, organic matter present (twigs + roots), grey to grey-brown, low moisture.
NATURAL 3	SILT, calcareous, light-brown to orange-brown, low moisture.
NATURAL 4	CLAY, silty, low-plasticity, light-brown to orange-brown, trace calcareous gravels, moist.
NATURAL 5	CLAY, silty, low plasticity, yellow-brown to white, talc-like feel, moist.

The subsurface conditions across the site were highly variable, with 11 distinct layers of fill materials and five distinct layers of natural materials observed within the test pits excavated across the site. In total, 10 out of 11 test pits contained fill materials, with only test pit TP8 containing natural materials only.

The vertical extent of fill materials encountered from the surface ranged between 0.5m depth (TP2) and 3.8m depth (TP10), with underlying natural soils confirmed at all test pit locations with the exception of test pit TP07 where fill materials existed to the maximum depth of investigation of 3.3m below ground surface.

Non-mineralogical inclusions were identified within all test pits except for TP8 (natural soils only), were present in 8 out of the 11 distinct layers of fill materials encountered, and were observed in the form of the following materials:

- Bitumen wastes ranging in size from small fragments of ~10mm up to large pieces ~400mm width (10 out of 11 test pits);
- Concrete, bricks and / or pavers (10 out of 11 test pits);
- Construction and demolition waste / building wastes including ceramic tiles / black or orange plastic / PVC pipe (5 out of 11 test pits);
- Trace ash and cinders (5 out of 11 test pits);
- Trace small fragments of slag (2 out of 11 test pits); and
- Trace remnants of partially solidified bituminous tar (1 out of 11 test pits);
- Potential asbestos containing materials (ACMs) in the form of trace grey fibre cement fragments in test pit TP07 at depths of between 1.9m-2.7m within materials designated as the 'FILL 7' layer. No other potential ACMs were encountered in any of the other test pits excavated at the site, with the 'FILL 7' layer also only observed within soils at test pit TP07.

No other observations of potential chemical impacts (i.e. odours, staining) were observed during test pitting or soil sampling activities.

PID results were recorded up to a maximum of 0.3ppm, indicating that the potential for volatile contaminants was low within the test pits excavated across the site.

3.4.3 Soil Analytical Results – Tier 1 Screening

All soil analytical results were compared to the human health and ecological assessment criteria summarised in **Section 4** above, with a summary table results included in **Appendix K** which highlights any exceedances of the soil assessment criteria adopted for the site.

The laboratory Certificates of Analysis and associated Chain of Custody Documentation are included in **Appendix L**.

All soil analytical results reported concentrations of all chemicals below the adopted ASC NEPM (2013) human health and ecological criteria with the exception of the following samples:

- TP3_0.1-0.2 (FILL 1 layer) reported benzo(a)pyrene concentration of 3.8mg/kg which exceeds the ASC NEPM ESL criteria of 3mg/kg;
- TP3_0.1-0.2 (FILL 1 layer) reported a benzo(a)pyrene toxic equivalent (TEQ) concentration of 5.5mg/kg which exceeds the ASC NEPM HIL A + HIL C criteria of 3mg/kg;
- TP6_0.1-0.2 (FILL 1 layer) reported benzo(a)pyrene concentration of 3.7mg/kg which exceeds the ASC NEPM ESL criteria of 3mg/kg; and
- TP6_0.1-0.2 (FILL 1 layer) reported a benzo(a)pyrene TEQ concentration of 5.2mg/kg which exceeds the ASC NEPM HIL A + HIL C criteria of 3mg/kg.

3.4.4 Benzo(a)pyrene in Fill – Tier 2 Screening

Given the above isolated chemical exceedances of benzo(a)pyrene and benzo(a)pyrene TEQ concentrations reported in shallow soils at the site, a statistical analyses of the relevant data sets (where n=22) was completed using US EPA ProUCL software.

Results of the statistical interpretation of benzo(a)pyrene concentrations indicated the following:

- Maximum = 3.8mg/kg which is less than 2.5 x the ESL criteria of 3mg/kg;
- 95% UCL = 1.78mg/kg which is less than 1 x the ESL criteria of 3mg/kg; and
- Standard Deviation = 0.942mg/kg which is less than 0.5 x the ESL criteria of 3mg/kg.

Results of the statistical interpretation of benzo(a)pyrene TEQ concentrations indicated the following:

- Maximum = 5.5mg/kg which is less than 2.5 x the HIL A / HIL C criteria of 3mg/kg;
- 95% UCL = 2.198mg/kg which is less than 1 x the HIL A / HIL C criteria of 3mg/kg; and
- Standard Deviation = 1.2mg/kg which is less than 0.5 x the HIL A / HIL C criteria of 3mg/kg.

On the basis of the above statistical outputs, both the benzo(a)pyrene and benzo(a)pyrene TEQ concentrations reported within shallow soils at the site are considered to statistically comply with the ASC NEPM (2013) human health and environmental investigation / screening levels adopted for the site.

Despite the benzo(a)pyrene concentrations statistically complying with the adopted Tier 1 investigation levels for the protection of human health and the environment in a residential setting, a Tier 2 risk assessment was undertaken, as documented below.

The original ESLs for benzo(a)pyrene adopted in the ASC NEPM (as amended in 2013) were 0.7mg/kg for urban residential and public open space and 1.4mg/kg for commercial and industrial. These numbers were adopted from provisional Canadian environmental health soil quality guidelines (SQG_E), following a review (by Dr Michael Warne) in early 20101 for the ASC NEPM variation.

The Canadian soil quality guidelines for PAHs were revised in 2010, subsequent to the Warne review being completed and the amendment of the ASC NEPM:

- Canadian Council of Ministers of the Environment (CCME), 2010. Canadian Soil Quality Guidelines for Carcinogenic and Other Polycyclic Aromatic Hydrocarbons (Environmental and Human Health Effects). Scientific Criteria Document (revised).
- Canadian Council of Ministers of the Environment, 2010. Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health: Carcinogenic and Other PAHs

New toxicological data/information is used and presented in the 2010 CCME SQG guidance which clearly state that the benzo(a)pyrene values developed in 1997 and presented in the 1999 document have now been superseded by the 2010 values. The 2010 CCME SQGE are 20mg/kg for residential/parkland and 72 mg/kg for commercial. The 2010 Canadian SQGE relevant for residential / parkland use is significantly higher than the corresponding ASC NEPM ESL.

The ASC NEPM ESLs for benzo(a)pyrene are recognised as being based on limited data and are considered to be of low reliability and therefore application and reliance on the B(a)P ESLs (derived from the 1999 SQGE) may lead to an overly conservative approach to site assessment and remediation.

On this basis, the measured benzo(a)pyrene concentrations are not considered to present a risk to ecological receptors in a residential setting.

[1] Review of the appropriateness of selected Canadian Soil Quality Guidelines (benzene, benzo(a)pyrene, ethylbenzene, toluene and xylenes) for incorporation into the Australian National Environment Protection (Assessment of Site Contamination) Measure and recommended Ecological Investigation Levels by Dr Michael Warne (2013 corrected version for benzo(a)pyrene)

3.4.5 Asbestos Containing Materials

During soil investigations completed at the site in October 2019, a number of potential asbestos containing materials ('ACM') fragments in the form of small pieces of bonded fibre cement were observed and collected from the 'FILL 7' layer encountered within test pit TP07 at an approximate depth of between 1.9m-2.7m below ground surface.

The results of laboratory testing of the potential ACM fibre cement fragments confirmed the presence of chrysotile, amosite and crocidolite asbestos.

Potential ACMs were not observed in any other test pits during the site investigations.

3.4.6 Potential Aesthetic Issues

Consideration of the aesthetic suitability of soil materials encountered was undertaken to determine if any potential human health and / or environmental issues are likely to exist that require management due to the presence of residual foreign inert materials

As stated in **Section 4.4** above, sites that contain residual non-hazardous inert materials that present no health hazard (such as brick fragments and cement wastes) are usually of low concern for both non-sensitive and sensitive land uses.

The presence of non-mineralogical inclusions observed within the imported fill layers at the site was primarily in the form of inert materials consisting of concrete, bricks, pavers, ceramic tiles, plastic sheeting and PVC pipe.

While bitumen materials ranging in size from approximately 10mm-400mm were identified within specific layers of fill materials at most test pit locations, remaining soil inclusions in the form of partially solidified bituminous tar, ash, cinders and slag were only noted in trace amounts.

Furthermore, although ACMs in the form of grey fibre cement fragments were confirmed within test pit TP07 at depths of between 1.9m-2.7m (FILL 7 layer), no other potential ACMs were encountered in any of the other test pits excavated at the site.

3.4.7 Soil Data Validation

The soil assessment activities conducted as part of this site investigation were subject to data validation processes to ensure that the data obtained via sample collection, handling, and laboratory analyses procedures is reliable.

All information relating to Data Quality Objectives ('DQOs') and the field and laboratory quality assurance ('QA') and quality control ('QC') measures are presented in **Appendix M**, and have been reviewed and validated in order to provide confidence that the soil analytical data is reliable for the purposes of this assessment.

4 CONCLUSIONS + RECOMMENDATIONS

In relation to the stated objectives above, the findings of the investigation are:

1. **Suitability of fill for residential and private open space uses:**

    a. The materials encountered in the filled area are heterogenous, with various layers of fill materials and natural soils observed within the test pits excavated across the inferred filled area at the site.
    b. The depth of fill materials ranged between 0.5m and 3.8m depth below the current surface, with underlying natural soils confirmed at all test pit locations except for test pit TP07, where fill materials were present to the maximum depth of investigation of 3.3m.
    c. Photoionisation detector (PID) results were recorded up to a maximum of 0.3ppm, indicating that the potential for volatile contaminants was low.
    d. In addition to the soil materials, non-mineralogical inclusions were observed within most fill layers, primarily in the form of construction and demolition materials including concrete, bitumen, bricks, pavers, ceramic tiles, plastic sheeting and PVC pipe. Trace inclusions of tar, ash, cinders and slag were observed at some locations.
    e. Asbestos containing materials (ACMs) were confirmed in the form of grey fibre cement fragments within test pit TP07 at depths of between 1.9m-2.7m (FILL 7 layer). No other potential ACMs were encountered in any of the other test pits excavated at the site.
    f. No significant indicators of potential contamination (i.e. odours, staining) were observed during test pitting or soil sampling activities.
    g. All results were below the adopted Tier 1 health based and ecological screening levels for residential land use, except for two individual benzo(a)pyrene concentrations in near surface soils (0.1-0.2m) at locations TP3 and TP6. A Tier 2 risk assessment comprising statistical assessment and review of toxicological data for benzo(a)pyrene was undertaken, which confirmed that these concentrations do not present a risk to human health or ecological risk in the context of residential use. On this basis, the fill materials are not considered to present an unacceptable risk to human health or the environment in the context of residential land use, including private open space areas.

2. **Risk to surface or underground waters from the fill:**

    a. No significant soil concentrations were identified in soils at the site that are considered to threaten surface or groundwater. As stated in the ASC NEPM, '*Groundwater protection may be a particular concern where contamination occurs in sandy soils containing naturally low levels of organic matter, clay and trace elements. In most situations, soil contaminants at levels below appropriate EILs or HILs do not pose a threat to local groundwater sources.*' On this basis, no risk to surface or underground waters has been identified.

3. **Pre- and post-filling levels and depth of fill:**

    a. **Figure 2** shows the pre- and post-filling contours in relation to site features.
    b. **Figure 3** shows the inferred depth of fill based on the difference between these two surveys, which was confirmed through the test pit investigations. The depth of fill ranges from 0m to approximately 5m in the central part of the allotment to the north of the current dwelling.

The following recommendations are made:

- Any soil imported to the site should be sourced from a commercial supplier where possible. Should waste soils be generated from another site to be imported to the site, then the soils should be classified and imported in accordance with EPA requirements.

- All surplus soils to be removed from the site must be managed in accordance with relevant EPA guidelines and/or requirements of waste or recycling depots authorised by the EPA.
- Construction and demolition waste materials should be disposed off-site in accordance with the requirements of waste or recycling depots authorised by the EPA.
- Should any unforeseen materials (including asbestos containing materials) be identified during any excavation works and /or soil handling and management activities, it is recommended that these soils are quarantined, and further advice is sought from an appropriately qualified environmental consultant.

This report and the opinions expressed above are subject to the limitations presented in **Section 5**. It is important that the reader make themselves aware of these limitations.

5 LIMITATIONS

Scope of Services

This Environmental Soil Investigation ('the report') has been prepared in accordance with the scope of services set out in the contract, or as otherwise agreed, between the Botten Levinson Lawyers and Mud Environmental ('scope of services'). In some circumstances, the scope of services may have been limited by a range of factors such as time, budget, access and/or site disturbance constraints.

Reliance on Data

In preparing the report, Mud Environmental has relied upon data, surveys, analyses, designs, plans and other information provided by Botten Levinson Lawyers and other individuals and organisations, most of which are referred to in the report ('the data'). Except as otherwise stated in the report, Mud Environmental has not verified the accuracy or completeness of the data. To the extent that the statements, opinions, facts, information, conclusions and/or recommendations in the report ('conclusions') are based in whole or part on the data, those conclusions are contingent upon the accuracy and completeness of the data. Mud Environmental will not be liable in relation to incorrect conclusions should any data, information or condition be incorrect or have been concealed, withheld, misrepresented or otherwise not fully disclosed to Mud Environmental.

Desktop Environmental Conclusions

In accordance with the scope of services, Mud Environmental has relied upon the data and has conducted desktop site history research in the preparation of the report. The nature and extent of investigation conducted is described in the report.

No desktop investigation, no matter how thorough, can eliminate the possibility that not all potentially contaminating activities were identified, or provide sufficient confidence to determine the suitability of a site for a given use. The conclusions are based only upon the data and information available to Mud Environmental at the time of preparing this report.

Within the limitations imposed by the scope of services, the investigation and preparation of this report have been undertaken and performed in a professional manner, in accordance with generally accepted practices and using a degree of skill and care ordinarily exercised by reputable environmental consultants under similar circumstances. No other warranty, expressed or implied, is made.

Report for Benefit of Botten Levinson Lawyers

The report has been prepared for the benefit of Botten Levinson Lawyers and no other party. Mud Environmental assumes no responsibility and will not be liable to any other person or organisation for or in relation to any matter dealt with or conclusions expressed in the report, or for any loss or damage suffered by any other person or organisation arising from matters dealt with or conclusions expressed in the report (including without limitation matters arising from any negligent act or omission of Mud Environmental or for any loss or damage suffered by any other party relying upon the matters dealt with or conclusions expressed in the report). Other parties should not rely upon the report or the accuracy or completeness of any conclusions and should make their own enquiries and obtain independent advice in relation to such matters.

Other Limitations

Mud Environmental will not be liable to update or revise the report to take into account any events or emergent circumstances or facts occurring or becoming apparent after the date of the report.

Approximate fill thickness contours are based on regional topographc contours compared with recent survey data. Accuracy is dependent on the two datasets compared and some spatial and vertical discprency with observed fill thickness is to be expected. The recent fill thickness aims to omit previous land filling completed during house construction, therefore total fill thickness nearer the dwelling will be thicker.

Our ref: JAL/216265

16 December 2019

Mr Adrian Webber
Mud Environmental Pty Ltd
PO Box 80
HENLEY BEACH SA 5022

By email: adrian@mudenvironmental.com.au

Dear Adrian

DA 13/30/473- 28 Emmett Road, Crafers West

This firm acts for the application for this development proposal.

The Council has requested an assessment be undertaken by a suitably qualified site contamination consultant to -

1. Confirm that the fill placed on the site is suitable for residential purposes (including the private open space associated with the dwelling;

2. Confirm that there is no risk of pollution to surface or underground waters from the fill; and

3. Ascertain (and plot) the pre 2010 land form, the existing land form with the fill in situ and the final form of the land as proposed.

I would be grateful if you would provide a report to me with answers to those questions based on your site investigations and testing.

Yours faithfully

James Levinson

APPENDIX E

Site Inspection & Test Pitting Photographs (Mud Environmental, October 2019)

Photograph 1 – View to the west from the eastern site boundary. Excavated fire track is located to the right of photo below the batter slope (14 October 2019).

Photograph 2 – View to the north-east from the grassed area in front (north-west) of the building. Folder location shows approximate site boundary prior to fill importation (14 October 2019).

Photograph 3 – View to the south-west from the grassed area in front (north-west) of the building. Folder location shows approximate site boundary prior to fill importation (14 October 2019).

Photograph 4 – Brick fragments in existing driveway fill materials - view to the north (14 October 2019).

Photograph 5 – Bitumen fragments in fill materials adjacent north-eastern corner of building - view to the north (14 October 2019).

Photograph 6 – Bitumen fragments in fill materials in main batter slope between building and fire track - view to the north-west (14 October 2019).

Photograph 7 – Concrete, bricks and bitumen fragments in wall of main batter slope between building and fire track - view to the west (14 October 2019).

Photograph 8 – View to the south from the bottom of the fire track - looking up topographical gradient at fill materials comprising the main batter slope. Existing building atop the rise (14 October 2019).

Photograph 9 – View to the north away from the site (28 October 2019).

Photograph 10 – Test Pit TP01 profile located adjacent north-western corner of building. FILL 1 (silty SAND) + FILL 2 (grey GRAVEL) layers present to ~0.6m, underlain by natural silty clays (28 October 2019).

Photograph 11 – Paving bricks & trace bitumen in FILL 1 layer (0-0.4m) in TP01 (28 October 2019).

Photograph 12 – View to the south-west at test pit TP02 location (28 October 2019).

Photograph 13 – Paving bricks & trace concrete in FILL 1 layer (0-0.45m) in TP02 (28 October 2019).

Photograph 14 – Test pit TP02: Orange sandy loam (FILL 3 layer) @ 0.45-0.5m between overlying FILL 1 layer (0-0.45m) and underlying NATURAL 1 silty, gravelly, CLAY materials from 0.45m (28 October 2019).

Photograph 15 – Test pit TP03: Trace oversized fragments of concrete and bitumen + bituminous tar pieces within the FILL 5 layer located at ~1.9-2.5m (28 October 2019).

Photograph 16 – Test pit TP03: Trace bituminous tar within the FILL 5 layer at 1.9-2.5m (28 October 2019).

Photograph 17 – Test pit TP03: NATURAL 2 grey-brown organic SILT layer @ ~3.0m (28 October 2019).

Photograph 18 – View to the west at test pit TP04 location (28 October 2019).

Photograph 19 – View of northern wall of test pit TP04 showing bitumen inclusions and trace bituminous tar pieces within mixed (FILL 4 + FILL 5 + FILL 6) fill materials to ~1.5m (28 October 2019).

Photograph 20 – View to the west at TP05 location adjacent the eastern site boundary (28 October 2019).

Photograph 21 – View of test pit TP06 location marked 'X' to the north and down the imported fill batter slope towards the base of the fire track (28 October 2019).

Photograph 22 – View to the north-west at excavation of soils within TP06. Oversized bricks prevalent within the initial FILL 6 layer located at ~0.2-0.8m below surface (28 October 2019).

Photograph 23 – Test pit TP07 excavation view towards the north-west (28 October 2019).

Photograph 24 – Test pit TP07 multiple fill layers within top 1.1m (28 October 2019).

Photograph 25 –TP07 oversized concrete inclusions in FILL 5 layer from 1.1-2.0m (28 October 2019).

Photograph 26 – Test pit TP07: Confirmed Asbestos Containing Materials (ACM) fragments located within the FILL 7 layer present at approximately 2.0-2.7m (28 October 2019).

Photograph 27 – View to the south from the bottom of the fire track. Test pit TP08 excavated within natural soils at base of fill slope (28 October 2019).

Photograph 28 – Test pit TP08 in natural soils at northern end / base of fill batter slope (28 October 2019).

Photograph 29 – Test pit TP09 excavated into wall of batter slope, looking to the south (28 October 2019).

Photograph 30 – Test pit TP09 interface between FILL 10 materials (trace oversized bitumen, rocks and concrete) and NATURAL 2 grey-brown organic SILT layer @ 1.8m below surface (28 October 2019).

Photograph 31 – Excavation of test pit TP10 - View north-west down the fire track (28 October 2019).

Photograph 32 – Excavation of test pit TP10 - View north-west down the fire track (28 October 2019).

Photograph 33 – Test pit TP10: FILL 11 & FILL 9 layers with bitumen in top 1m (28 October 2019).

Photograph 34 –Test pit TP10: Multiple fill layers observed. Bitumen pieces present from ~0.9-1.4m below surface throughout FILL 10 layer (28 October 2019).

Photograph 35 – Excavation of TP11: View south-west towards the existing building (28 October 2019).

Photograph 36 – Test pit TP11 looking to the north-east. Bitumen fragments up to 350mm + oversized physical inclusions of rocks/cobbles/quartz ballast in FILL 8 layer @ ~1.9-2.8m (28 October 2019).

APPENDIX F

Site Photographs (2004 to 2013)

Site Photographs
Circa 2004

Photograph 1 – View to the north-west from the top of the fire track (circa 2004).

Photograph 2 – View to the north from the top of the fire track (circa 2004).

Photograph 3 – View to the west from the top of the fire track (circa 2004).

Photograph 4 – View to the south from the top of the fire track (circa 2004).

Photograph 5 – View to the north-west from the eastern boundary adjacent the residence (circa 2004).

Photograph 6 – View to the west from the rear yard immediately north of the residence (circa 2004).

Site Photographs
Circa 2012

Photograph 7 – View to the south-east from edge of the batter slope (circa 2012).

Photograph 8 – View to the south from edge of the batter slope (circa 2012).

Photograph 9 – View to the north-west from the top of the fire track (circa 2012).

Photograph 10 – View to the north-west from the top of the fire track (circa 2012).

Photograph 11 – View to the north-west from the top of the fire track (circa 2013).

Photograph 12 – View to the south-east from edge of the batter slope (circa 2012).

Photograph 13 – View to the north from edge of the eastern boundary adjacent residence (circa 2013).

APPENDIX J

Test Pit Logs + Explanatory Notes

BORELOG EXPLANATORY NOTES

Unified Soil Classification

Mud Environmental field logging uses symbology consistent with the Unified Soil Classification System (USCS). Appropriate symbols are selected based on limited visual examination only and are not for geotechnical classification, foundation and/or footing design.

Major divisions			Group symbol	Group name
Coarse grained soils - more than 50% retained on 0.075 mm sieve	*gravel* > 50% of coarse fraction retained on 4.75 mm sieve	clean gravel <5% smaller 0.075 mm sieve	**GW**	well-graded gravel, fine to coarse gravel
			GP	poorly graded gravel
		gravel with >12% fines	**GM**	silty gravel
			GC	clayey gravel
	sand ≥ 50% of coarse fraction passes 4.75 mm sieve	clean sand	**SW**	well-graded sand, fine to coarse sand
			SP	poorly graded sand
		sand with >12% fines	**SM**	silty sand
			SC	clayey sand
Fine grained soils - more than 50% passing 0.075 mm sieve	*silt and clay* liquid limit < 50	inorganic	**ML**	silt
			CL	clay of low plasticity, lean clay
		organic	**OL**	organic silt, organic clay
	silt and clay liquid limit ≥ 50	inorganic	**MH**	silt of high plasticity, elastic silt
			CH	clay of high plasticity, fat clay
		organic	**OH**	organic clay, organic silt
Highly organic soils			**Pt**	peat

Additional Lithology Symbols

	Fill material
	Bitumen
	Concrete

Groundwater Well Completion Symbols

	Ground level flush gatic cover, concreted
	Standpipe, concreted
	Grout consisting of cement +/- bentonite mix
	Bentonite plug

	Sand filter pack
	Endcap
	Blank PVC casing
	Slotted PVC casing and standing water level

NOTES:

NC = Not Calculated

As site-specific soil characteristics of pH, CEC and clay content were not directly measured during soil investigations, the added contaminat limits (ACLs) calculated for the site are based on the average pH values across all soil samples tested (n=22) and by applying highly conservative values for cation exchange capacity (CEC = 5 cmolc/kg dwt) and clay content (1%). In addition, the ambient background concentrations (ABCs) for chromium III (CrIII), copper (Cu), nickel (Ni) and zinc (Zn) were calcuated using the average of all samples anlaysed (n=20). Site-specific EILs were then calculated for chromium III (CrIII), copper (Cu), nickel (Ni) and zinc (Zn) based on this conservation approach to determination ABc and ACLs.

NOTES:

NC = Not Calculated

As site-specific soil characteristics of pH, CEC and clay content were not directly measured during soil investigations, the added contaminat limits (ACLs) calculated for the site are based on the average pH values across all soil samples tested (n=22) and by applying highly conservative values for cation exchange capacity (CEC = 5 cmolc/kg dwt) and clay content (1%). In addition, the ambient background concentrations (ABCs) for chromium III (CrIII), copper (Cu), nickel (Ni) and zinc (Zn) were calcuated using the average of all samples anlaysed (n=20). Site-specific EILs were then calculated for chromium III (CrIII), copper (Cu), nickel (Ni) and zinc (Zn) based on this conservation approach to determination ABc and ACLs.

NOTES:

NC = Not Calculated

As site-specific soil characteristics of pH, CEC and clay content were not directly measured during soil investigations, the added contaminat limits (ACLs) calculated for the site are based on the average pH values across all soil samples tested (n=22) and by applying highly conservative values for cation exchange capacity (CEC = 5 cmolc/kg dwt) and clay content (1%). In addition, the ambient background concentrations (ABCs) for chromium III (CrIII), copper (Cu), nickel (Ni) and zinc (Zn) were calcuated using the average of all samples anlaysed (n=20). Site-specific EILs were then calculated for chromium III (CrIII), copper (Cu), nickel (Ni) and zinc (Zn) based on this conservation approach to determination ABc and ACLs.

Normal UCL Statistics for Uncensored Full Data Sets

SITE SPECIFIC SOIL PROPERTIES FOR ADDED CONTAMINANT LIMITS (ACLs) DERIVATION

	% Clay*	CEC (cmolc/kg dwt)	pH Average (n=22)
	%	meq/100g	-
	1	0.05	0.1
Values	1	1	8

SITE SPECIFIC SOIL CONCENTRATIONS FOR AMBIENT BACKGROUND CONCENTRATIONS (ABCs) DERIVATION

	Chromium (III+VI)	Copper	Nickel	Zinc
	mg/kg	mg/kg	mg/kg	mg/kg
Average (n=20)	26.3	13.5	15.1	43.9

Arsenic

Outputs

Land use	Arsenic generic EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	20	40
Urban residential and open public spaces	50	100
Commercial and industrial	80	160

DDT

Outputs

Land use	DDT generic EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	3	3
Urban residential and open public spaces	180	180
Commercial and industrial	640	640

Lead

Outputs

Land use	Lead generic EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	110	470
Urban residential and open public spaces	270	1100
Commercial and industrial	440	1800

Naphthalene

Outputs

Land use	Naphthalene generic EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	10	10
Urban residential and open public spaces	170	170
Commercial and industrial	370	370

Chromium III

Inputs
Select contaminant from list below
Cr III
Below needed to calculate fresh and aged ACLs
Enter % clay (values from 0 to 100%)
1
Below needed to calculate fresh and aged ABCs
Measured background concentration (mg/kg). Leave blank if no measured value
26.3
or for fresh ABCs only
Enter iron content (aqua regia method) (values from 0 to 50%) to obtain estimate of background concentration
or for aged ABCs only
Enter State (or closest State)
SA
Enter traffic volume (high or low)
low

Outputs		
Land use	Cr III soil-specific EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	50	85
Urban residential and open public spaces	100	210
Commercial and industria	150	340

Nickel

Inputs
Select contaminant from list below
Ni
Below needed to calculate fresh and aged ACLs
Enter cation exchange capacity (silver thiourea method) (values from 0 to 100 cmolc/kg dwt)
5
Below needed to calculate fresh and aged ABCs
Measured background concentration (mg/kg). Leave blank if no measured value
15.1
or for fresh ABCs only
Enter iron content (aqua regia method) (values from 0 to 50%) to obtain estimate of background concentration
or for aged ABCs only
Enter State (or closest State)
SA
Enter traffic volume (high or low)
low

Outputs		
Land use	Ni soil-specific EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	15	20
Urban residential and open public spaces	25	45
Commercial and industria	35	70

Zinc

Inputs
Select contaminant from list below
Zn
Below needed to calculate fresh and aged ACLs
Enter cation exchange capacity (silver thiourea method) (values from 0 to 100 cmolc/kg dwt)
5
Enter soil pH (calcium chloride method) (values from 1 to 14)
8
Below needed to calculate fresh and aged ABCs
Measured background concentration (mg/kg). Leave blank if no measured value
43.9
or for fresh ABCs only
Enter iron content (aqua regia method) (values from 0 to 50%) to obtain estimate of background concentration
or for aged ABCs only
Enter State (or closest State)
SA
Enter traffic volume (high or low)
low

Outputs		
Land use	Zn soil-specific EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	65	95
Urban residential and open public spaces	130	280
Commercial and industria	190	410

Copper

Inputs
Select contaminant from list below
Cu
Below needed to calculate fresh and aged ACLs
Enter cation exchange capacity (silver thiourea method) (values from 0 to 100 cmolc/kg dwt)
5
Enter soil pH (calcium chloride method) (values from 1 to 14)
8
Enter organic carbon content (OOC) (values from 0 to 50%)
1
Below needed to calculate fresh and aged ABCs
Measured background concentration (mg/kg). Leave blank if no measured value
13.5
or for fresh ABCs only
Enter iron content (aqua regia method) (values from 0 to 50%) to obtain estimate of background concentration
or for aged ABCs only
Enter State (or closest State)
SA
Enter traffic volume (high or low)
low

Outputs		
Land use	Cu soil-specific EILs (mg contaminant/kg dry soil)	
	Fresh	Aged
National parks and areas of high conservation value	35	45
Urban residential and open public spaces	60	110
Commercial and industria	85	150

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Eurofins | mgt Suite B9			
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Nov 01, 2019	14 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ug/L: micrograms per litre
ppm: Parts per million
ppb: Parts per billion
%: Percentage
org/100mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference.
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Attention:	Adrian Webber
Report	685395-AID
Project Name	LEVINSONS CRATES
Project ID	ME-296
Received Date	Oct 30, 2019
Date Reported	Nov 07, 2019

Methodology:

Asbestos Fibre Identification	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. *NOTE: Positive Trace Analysis results indicate the sample contains detectable respirable fibres.*
Unknown Mineral Fibres	Mineral fibres of unknown type, as determined by PLM with DS, may require another analytical technique, such as Electron Microscopy, to confirm unequivocal identity. *NOTE: While Actinolite, Anthophyllite and Tremolite asbestos may be detected by PLM with DS, due to variability in the optical properties of these materials, AS4964 requires that these are reported as UMF unless confirmed by an independent technique.*
Subsampling Soil Samples	The whole sample submitted is first dried and then passed through a 10mm sieve followed by a 2mm sieve. All fibrous matter greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) is employed. *NOTE: Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis, in accordance with AS 4964-2004.*
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated for identification by PLM and DS. Where required, interfering matrices may be removed by disintegration using a range of heat, chemical or physical treatments, possibly in combination.The resultant material is then further examined in accordance with AS 4964 - 2004. *NOTE: Even after disintegration it may be difficult to detect the presence of asbestos in some asbestos-containing bulk materials using PLM and DS. This is due to the low grade or small length or diameter of the asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials. Vinyl/asbestos floor tiles, some asbestos-containing sealants and mastics, asbestos-containing epoxy resins and some ore samples are examples of these types of material, which are difficult to analyse.*
Limit of Reporting	The performance limitation of the AS 4964 (2004) method for non-homogeneous samples is around 0.1 g/kg (equivalent to 0.01% (w/w)). Where no asbestos is found by PLM and DS, including Trace Analysis, this is considered to be at the nominal reporting limit of 0.01% (w/w). The NEPM screening level of 0.001% (w/w) is intended as an on-site determination, not a laboratory Limit of Reporting (LOR), per se. Examination of a large sample size (e.g. 500 mL) may improve the likelihood of detecting asbestos, particularly AF, to aid assessment against the NEPM criteria. Gravimetric determinations to this level of accuracy are outside of AS 4964 and hence NATA Accreditation does not cover the performance of this service (non-NATA results shown with an asterisk). *NOTE: NATA News March 2014, p.7, states in relation to AS 4964: "This is a qualitative method with a nominal reporting limit of 0.01 % " and that currently in Australia "there is no validated method available for the quantification of asbestos".This report is consistent with the analytical procedures and reporting recommendations in the NEPM and the WA DoH.*

TP7_2.0-2.7	19-Oc46604	Oct 28, 2019	Approximate Sample 198g / 180x120x4mm Sample consisted of: Grey compressed fibre cement fragments	Chrysotile, amosite and crocidolite asbestos detected.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Samples were analysed on an 'as received' basis.
4. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
5. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

Units

% w/w: weight for weight basis	grams per kilogram
Filter loading:	fibres/100 graticule areas
Reported Concentration:	fibres/mL
Flowrate:	L/min

Terms

Dry	Sample is dried by heating prior to analysis
LOR	Limit of Reporting
COC	Chain of Custody
SRA	Sample Receipt Advice
ISO	International Standards Organisation
AS	Australian Standards
WA DOH	Reference document for the NEPM. Government of Western Australia, Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia (2009), including supporting document Recommended Procedures for Laboratory Analysis of Asbestos in Soil (2011)
NEPM	National Environment Protection (Assessment of Site Contamination) Measure, 2013 (as amended)
ACM	Asbestos Containing Materials. Asbestos contained within a non-asbestos matrix, typically presented in bonded and/or sound condition. For the purposes of the NEPM, ACM is generally restricted to those materials that do not pass a 7mm x 7mm sieve.
AF	Asbestos Fines. Asbestos containing materials, including friable, weathered and bonded materials, able to pass a 7mm x 7mm sieve. Considered under the NEPM as equivalent to “non-bonded / friable”.
FA	Fibrous Asbestos. Asbestos containing materials in a friable and/or severely weathered condition. For the purposes of the NEPM, FA is generally restricted to those materials that do not pass a 7mm x 7mm sieve.
Friable	Asbestos-containing materials of any size that may be broken or crumbled by hand pressure. For the purposes of the NEPM, this includes both AF and FA. It is outside of the laboratory’s remit to assess degree of friability.
Trace Analysis	Analytical procedure used to detect the presence of respirable fibres in the matrix.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N/A	Not applicable

Asbestos Counter/Identifier:

Sayeed Abu	Senior Analyst-Asbestos (NSW)

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ug/L:** micrograms per litre
ppm: Parts per million	**ppb:** Parts per billion	**%:** Percentage
org/100mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Lab Sample ID	QA Source	Units	Result 1	Result 2	RPD	Acceptance Limits	Pass Limits	Qualifying Code
Method Blank									
Total Recoverable Hydrocarbons - 2013 NEPM Fractions									
TRH C6-C10			mg/L	< 0.02			0.02	Pass	
LCS - % Recovery									
Total Recoverable Hydrocarbons - 2013 NEPM Fractions									
TRH C6-C10			%	89			70-130	Pass	
Test	**Lab Sample ID**	**QA Source**	**Units**	**Result 1**			**Acceptance Limits**	**Pass Limits**	**Qualifying Code**

CERTIFICATE OF ANALYSIS

Work Order	: **EM1918495**	Page	: 1 of 6
Client	: **MUD ENVIRONMENTAL PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: ALL REPORTS	Contact	: Kieren Burns
Address	: PO Box 80 HENLEY BEACH SOUTH AUSTRALIA 5022	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: ----	Telephone	: +61881625130
Project	: ME-296	Date Samples Received	: 31-Oct-2019 09:30
Order number	: ----	Date Analysis Commenced	: 04-Nov-2019
C-O-C number	: ----	Issue Date	: 11-Nov-2019 11:57
Sampler	: ----		
Site	: Levinsons Crateus		
Quote number	: EN/222 - Seconday Work		
No. of samples received	: 2		
No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

Analytical Results

QUALITY CONTROL REPORT

Work Order	: **EM1918495**	Page	: 1 of 9
Client	: **MUD ENVIRONMENTAL PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: ALL REPORTS	Contact	: Kieren Burns
Address	: PO Box 80 HENLEY BEACH SOUTH AUSTRALIA 5022	Address	: 4 Westall Rd Springvale VIC Australia 3171
Telephone	: ----	Telephone	: +61881625130
Project	: ME-296	Date Samples Received	: 31-Oct-2019
Order number	: ----	Date Analysis Commenced	: 04-Nov-2019
C-O-C number	: ----	Issue Date	: 11-Nov-2019
Sampler	: ----		
Site	: Levinsons Crateus		
Quote number	: EN/222 - Seconday Work		
No. of samples received	: 2		
No. of samples analysed	: 1		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Nancy Wang	2IC Organic Chemist	Melbourne Organics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM1918495**	Page	: 1 of 5
Client	: **MUD ENVIRONMENTAL PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: ALL REPORTS	Telephone	: +61881625130
Project	: ME-296	Date Samples Received	: 31-Oct-2019
Site	: Levinsons Crateus	Issue Date	: 11-Nov-2019
Sampler	: ----	No. of samples received	: 2
Order number	: ----	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001	SOIL	In house: Referenced to Rayment and Lyons (2011) 4B3 (mod.) or 4B4 (mod.) 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM (2013) Schedule B(3)
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270D. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260B. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.

Preparation Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001-PR	SOIL	In house: Referenced to Rayment and Higginson 4B1, 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM (2013) Schedule B(3) (Method 103)
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ug/L: micrograms per litre
ppm: Parts per million
ppb: Parts per billion
%: Percentage
org/100mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	No
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Hi Michael

Thanks for chasing this up. We don't need PAH testing on this sample – please amend request.

All the best
Adrian

Hi Adrian,

Sample TP7_2.0-2.7 is Building material, was there another sample you had in mind?

Thanks,

Kind Regards,

Michael Cassidy

Hi Adrian,

We will get that organized.

SR – Please see below for additional analysis on standard TAT.

Kind Regards,
Savini Suduweli

Hi Savini

Can you please arrange for the following additional testing from this batch on **standard TAT**:

D.S 28/10

- **PAH:**
  - **TP1_0.4-0.5** OC46590 - 9466
  - **TP2_0.1-0.2** OC46591
  - **TP2_0.45-0.5** OC46592
  - **TP3_0.1-0.2** OC46593
  - **TP6_0.1-0.2** OC46599
  - **TP7_2.0-2.7**

Thanks in advance
Adrian

APPENDIX M

Soil Data Validation

APPENDIX M - Soil Data Validation

An evaluation of the QA/QC requirements of the laboratory testing data for soil samples collected at the site is provided below.

As part of the evaluation of laboratory chemical data, duplicate pair results were compared by determining the relative percentage difference (RPD) between the results. The RPD was calculated using the formula:

$$RPD\ (\%) = \frac{100 \times (X_1 - X_2)}{\bar{X}}$$

According to AS4482.1-2005 and the ASC NEPM:

- typical RPD values for range between ±30%; and
- a RPD within the range of -30% to 30% is considered to show acceptable agreement and, conversely data outside this range is considered to have poor agreement.

Generally higher RPD values occur for organic compounds than for metals and where low concentrations of an analyte are recorded.

All replicate and field sample results are presented in the summary tables included in **Appendix B**.

The results of internal laboratory quality control procedures are detailed in the laboratory certificates provided in **Appendix L**. The acceptance criterion for internal laboratory replicates is set at an RPD of -30% to 30%. Laboratory recoveries should be in the range 70% to 130%.

Table A below indicates conformance to QA/QC requirements for soil laboratory testing data.

Table A - Soil Data Validation

QA / QC Requirement	Compliant?	Comment
Chain of custody documentation completed	✓	All samples were transported under Mud Environmental chain of custody procedures.
Samples extracted within laboratory holding times	✓	All soil samples were delivered to the laboratories within the sample holding times and in laboratory-supplied containers.
All analyses NATA accredited	✓	The primary and secondary laboratories (Eurofins and ALS) are NATA accredited for all chemical analyses performed.
Equipment calibration	✓	The PID was calibrated by the supplier prior to soil sampling activities, and a fresh air calibration was undertaken on the PID prior to each day of use. A copy of the PID calibration certificate is included in **Appendix J**.
Intra-laboratory replicate frequency of at least 1:20	✓	One intra-laboratory replicate sample (QC2) was analysed for TRH, BTEX, PAHs, OCPs and metals, which complies with the 1:20 of primary samples tested recommended in guidance.
Intra-laboratory replicate sample RPDs within 30%-50%	✓	Where RPDs could be calculated, the field replicate samples were all within or close to between 30-50%, which is considered acceptable in accordance with published guidance. Overall the analyte pair RPD results indicated good data correlation between the primary sample and intra-laboratory replicate sample results.
Inter-laboratory replicate frequency of at least 1:20	✓	One intra-laboratory replicate sample (QC2A) was analysed for TRH, BTEX, PAHs, OCPs and metals, which complies with the 1:20 of primary samples tested recommended in guidance.
Inter-laboratory replicate sample RPDs within 30%-50%	✓	Where RPDs could be calculated, the field replicate samples were all within or close to between 30-50%, which is considered acceptable in accordance with published guidance. Overall the analyte pair RPD results indicated good data correlation between the primary sample and inter-laboratory replicate sample results.
Trip blanks frequency of at least 1 per batch	✓	One trip blank sample (QC1) was collected and submitted for TRH C6-C10 analysis.
Trip blank results below laboratory's LOR	✓	All chemical concentrations in the trip blank sample were reported below the laboratory LOR.

QA / QC Requirement	Compliant?	Comment
Rinsate (equipment) blanks frequency of at least 1 per batch	✓	No rinsate sample was collected as all soil samples were collected using the excavator bucket and dedicated disposable nitrile gloves.
Equipment Blank results below laboratory's LOR.	✓	N/A
Decontamination of Equipment	✓	Dedicated disposable gloves were used for the handling and collection of each individual soil sample.
Sample Preservation and Storage	✓	Samples were collected in laboratory supplied glass jars and were kept in a chilled insulated box and transported to the laboratory.
Laboratory Limits of Reporting (LOR)	✓	The laboratory LORs are presented in the Laboratory Certificates included in Appendix K (Excavation Validation Reports), Appendix L (post-demolition soil validation areas) and Appendix N (Stockpile Classification Reports). All laboratory LORs were below the adopted screening levels.
Acceptable laboratory QC results	✓	Laboratory internal QA/QC data, including duplicates, method blanks, laboratory control spikes and matrix spikes, were reviewed and are considered acceptable.

In summary, it is considered that the field and laboratory QA/QC measures implemented provide confidence that the data collected is reliable for the purposes of this assessment.

APPENDIX N

Honesty in Reporting Form

Site contamination—honesty in reporting

EPA South Australia

1 Site contamination consultant/auditor contact details *(this section is to be completed by the consultant or auditor)*

Form completed whilst engaged as a consultant [ ] or auditor [ ] *(tick only one box)*

Consultant/auditor company: Mud Environmental Pty Ltd.

Auditor accreditation number (if applicable): Not Applicable.

Postal address: PO Box 80
Henley Beach, SA 5022

Telephone: ( ) 0439 725 754

Email: adrian@mudenvironmental.com.au

Consultant/auditor reference: ME-296 Levinsons Crafers.

EPA reference number (if applicable): Not applicable.

Declaration:

I understand that it is an offence to provide false or misleading information to the Authority (section 120A of the Environment Protection Act 1993).

I understand that I must clearly qualify any statement of my opinion as to the existence of site contamination at the site by specifying the land uses that were taken into account in forming that opinion (section 103ZA of the Environment Protection Act 1993).

Maximum penalties range up to $15,000 for individuals to $60,000 for corporations.

Name:

Signature:

Position of signatory: Date:

2 Site information *(this section is to be completed by the consultant or auditor)*

Site name (if applicable): Levinsons Crafers

Site address: 28 Emmett Road, Crafers West, SA.

Certificate of Title number(s): CT 5917/721
DP 63108 A100

Date(s) of assessment: 14-28 October 2019.

Site owner and contact details: Mark Musolino
mark@innoveda.com.au.
0418 828 669.

Site occupier and contact details: As above.

Name, address and position of person requesting report: James Levinson
Botten Levinson Lawyers, jal@bllawyers, 82129777 & 0407 050 080.

Existing or proposed land use: Residential - low density

Consultant/auditor reference: ME-296 Levinsons Crafers.

3 **Person(s) providing information to site contamination consultants or auditors** *(this section is to be completed by each person who provides information to a consultant or an auditor)*

Section 103ZB of the Environment Protection Act 1993 states that:

> A person must not make a statement that the person knows to be false or misleading in a material particular (whether by reason of the inclusion or omission of any particular) in any information furnished to a site contamination auditor or site contamination consultant that might be relied on by the auditor or consultant in preparing a report relating to site contamination (whether or not required under this or any other Act).

Maximum penalties range from $30,000 for individuals to $60,000 for corporations.

Declaration:

I hereby declare I have read and that I understand section 103ZB of the Environment Protection Act 1993 printed above.
